100310
Low Skew 2:8 Differential Clock Driver

General Description

The 100310 is a low skew 8-bit differential clock driver which is designed to select between two separate differential clock inputs. The low output to output skew (< 50 ps) is maintained for either clock input. A LOW on the select pin (SEL) selects CLKINA, $\overline{\text{CLKINA}}$ and a HIGH on the SEL pin selects the CLKINB, $\overline{\text{CLKINB}}$ inputs.

The 100310 is ideal for those applications that need the ability to freely select between two clocks, or to maintain the ability to switch to an alternate or backup clock should a problem arise with the primary clock source.

A V_{BB} output is provided for single-ended operation.

Features

- Low output to output skew
- Differential inputs and outputs
- Allows multiplexing between two clock inputs
- Voltage compensated operating range: –4.2V to –5.7V
- Available to industrial grade temperature range (PLCC package only)

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum rating. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
