100329
Low Power Octal ECL/TTL Bidirectional Translator with Register

General Description

The 100329 is an octal registered bidirectional translator designed to convert TTL logic levels to 100K ECL logic levels and vice versa. The direction of the translation is determined by the DIR input. A LOW on the output enable input (OE) holds the ECL outputs in a cut-off state and the TTL outputs at a high impedance level. The outputs change synchronously with the rising edge of the clock input (CP) even though only one output is enabled at the time.

The cut-off state is designed to be more negative than a normal ECL LOW level. This allows the output emitter-followers to turn off when the termination supply is –2.0V, presenting a high impedance to the data bus. This high impedance reduces the termination power and prevents loss of low state noise margin when several loads share the bus.

The 100329 is designed with FAST™ TTL output buffers, featuring optimal DC drive and capable of quickly charging and discharging highly capacitive loads. All inputs have 50 kΩ pull-down resistors.

Note 4: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum rating. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

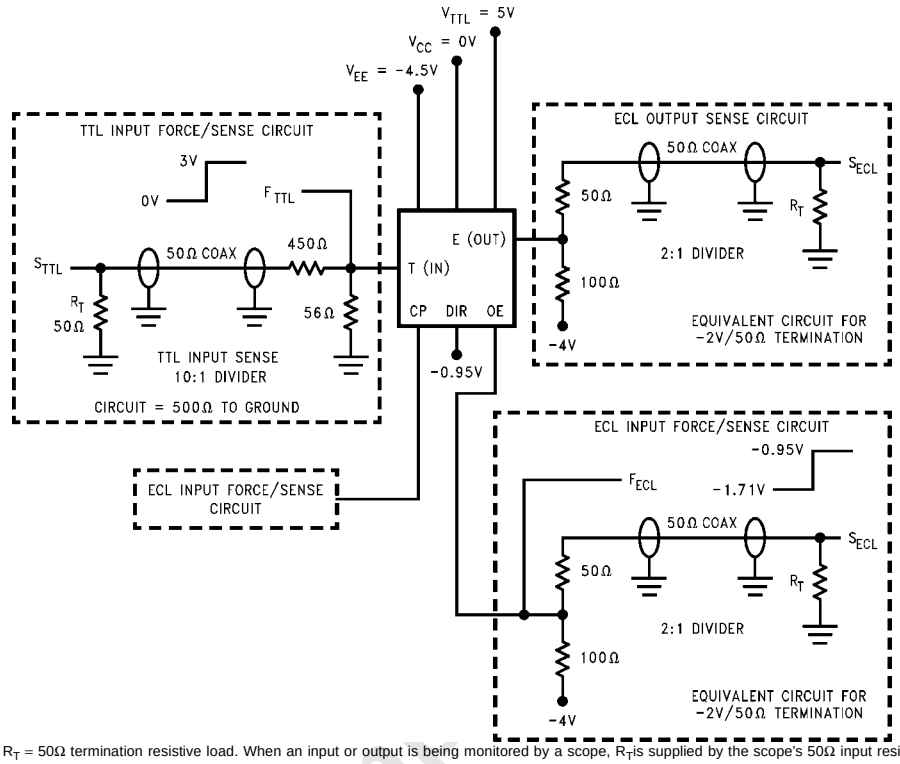
Test Circuitry (TTL-to-ECL)



Note 11: R_T = 50Ω termination resistive load. When an input or output is being monitored by a scope, R_T is supplied by the scope's 50Ω input resistance. When an input or output is not being monitored, an external 50Ω resistance must be applied to serve as R_T.

Note 12: TTL and ECL force signals are brought to the DUT via 50Ω coax lines.

Note 13: V_{TTL} is decoupled to ground with 0.1 µF, V_{EE} is decoupled to ground with 0.01 µF and V_{CC} is connected to ground.
