Quad 2-Input NAND Gate with Open-Collector Outputs

General Description

This device contains four independent gates each of which performs the logic NAND function. The open-collector outputs require external pull-up resistors for proper logical operation.

Pull-Up Resistor Equations

$$R_{MAX} = \frac{V_{CC} (Min) - V_{OH}}{N_1 (I_{OH}) + N_2 (I_{IH})}$$

$$\mathsf{R}_{MIN} = \frac{\mathsf{V}_{CC}\left(\mathsf{Max}\right) - \mathsf{V}_{OL}}{\mathsf{I}_{OL} - \mathsf{N}_{3}\left(\mathsf{I}_{IL}\right)}$$

Where: N_1 (I_{OH}) = total maximum output HIGH current

for all outputs tied to pull-up resistor

 N_2 (I_{IH}) = total maximum input HIGH current

for all inputs tied to pull-up resistor

 N_3 (I_{IL}) = total maximum input LOW current for all inputs tied to pull-up resistor

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
