FUSB302 Programmable USB Type-C Controller w/PD

Features

- Dual-Role Functionality with Autonomous DRP Toggle
- Ability to connect as either a host or a device based on what has been attached.
- Software configurable either as a dedicated host, dedicated device, or dual role.
 - Dedicated devices can operate both on a Type-C receptacle or a Type-C plug with a fixed CC and VCONN channel.
- Full Type-C 1.1 Support. Integrates the following functionality of the CC pin
 - Attach/Detach Detection as Host
 - Current Capability Indication as Host
 - Current Capability Detection as Device
 - Audio Adapter Accessory Mode
 - Debug Accessory Mode
 - Active Cable Detection
- Integrates CCx to VCONN switch with over-current limiting for powering USB3.1 Full Featured cables.
- USB Power Delivery (PD) 2.0, Version 1.1 Support
 - Automatic GoodCRC Packet Response
 - Automatic retries of sending a packet if a GoodCRC is not received
 - Automatic soft reset packet sent with retries if needed
 - Automatic Hard Reset Ordered Set Sent
- Dead Battery Support (SNK Mode Support when No Power Applied)
- Low Power Operation: I_{CC} = 25 μA (Typical)
- Packaged in 9-Ball WLCSP (1.215 mm x 1.260 mm) and 14-lead MLP (2.5 mm x 2.5 mm, 0.5 mm Pitch)

Description

The FUSB302 targets system designers looking to implement a DRP/SRC/SNK USB Type-C connector with low amount of programmability.

The FUSB302 enables the USB Type-C detection including attach, and orientation. The FUSB302 integrates the physical layer of the USB BMC power delivery protocol to allow up to 100 W of power and role swap. The BMC PD block enables full support for alternative interfaces of the Type-C specification.

Applications

- Smartphones
- Tablets
- Laptops
- Notebooks
- Power Adapters
- Cameras
- Dongles

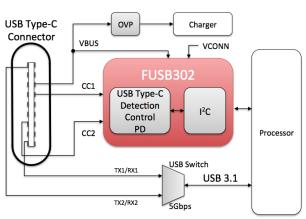

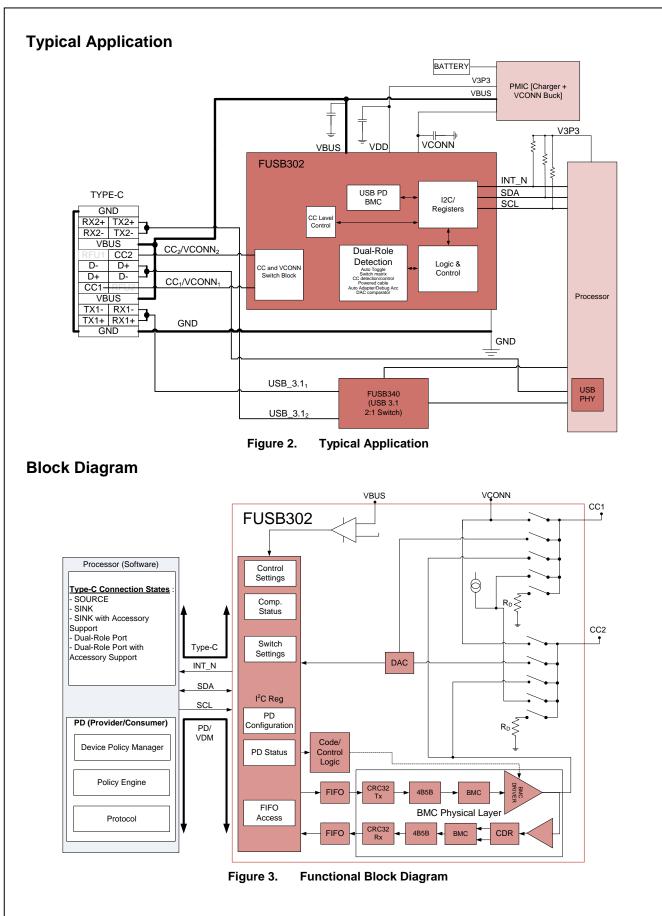

Figure 1. Block Diagram

Ordering Information

Part Number	Operating Temperature Range	Package	Packing Method
FUSB302UCX	-40 to 85°C	9-Ball Wafer-Level Chip Scale Package (WLCSP), 0.4 mm Pitch	Tape and Reel
FUSB302MPX		14-Lead MLP 2.5 mm x 2.5 mm, 0.5 mm Pitch	

Pin Configuration

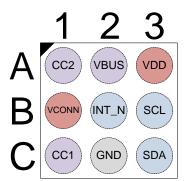

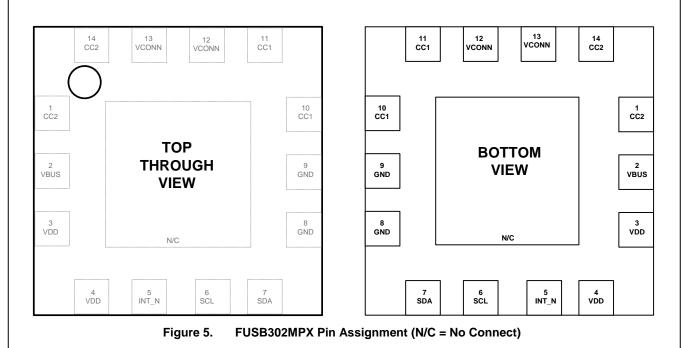

Figure 4. FUSB302UCX Pin Assignment (Top Through View)

Pin Map

	Column 1	Column 2	Column 3
Row A	CC2	VBUS	VDD
Row B	VCONN	INT_N	SCL
Row C	CC1	GND	SDA

Pin Descriptions

Name	Туре	Description
USB Type-C Co	nnector Interfac	ce
CC1/CC2	I/O	 Type-C connector Configuration Channel (CC) pins. Initially used to determine when an attach has occurred and what the orientation of the insertion is. Functionality after attach depends on mode of operation detected. Operating as a host: Sets the allowable charging current for VBUS to be sensed by the attached device Used to communicate with devices using USB BMC Power Delivery Used to detect when a detach has occurred Operating as a device: Indicates what the allowable sink current is from the attached hostUsed to communicate with devices using USB BMC Power Delivery
GND	Ground	Ground
VBUS	Input	VBUS input pin for attach and detach detection when operating as an upstream facing port (Device). Expected to be an OVP protected input.
Power Interfac	e	
VDD	Power	Input supply voltage.
VCONN	Power Switch	Regulated input to be switched to correct CC pin as VCONN to power USB3.1 full-featured cables and other accessories
Signal Interfac	ce	
SCL	Input	I ² C serial clock signal to be connected to the phone-based I ² C master.
SDA	Open-Drain I/O	I ² C serial data signal to be connected to the phone-based I ² C master
INT_N	Open-Drain Output	Active LOW open drain interrupt output used to prompt the processor to read the I^2C register bits

Type-C Detection

The FUSB302 implements multiple comparators and a programmable DAC that can be used by software to determine the state of the CC and VBUS pins. This status information provides the processor all of the information required to determine attach, detach and charging current configuration of the Type-C port connection.

The FUSB302 has three fixed threshold comparators that match the USB Type-C specification for the three charging current levels that can be detected by a Type-C device. These comparators automatically cause BC_LVL and COMP interrupts to occur when there is a change of state. In addition to the fixed threshold comparators, the host software can use the 6-bit DAC to determine the state of the CC lines more accurately.

The FUSB302 also has a fixed comparator that monitors if VBUS has reached a valid threshold or not. The DAC can be used to measure VBUS up to 20 V which allows the software to confirm that changes to the VBUS line have occurred as expected based on PD or other communication methods to change the charging level.

Detection through Autonomous Device Toggle

The FUSB302 has the capability to do autonomous DRP toggle. In autonomous toggle the FUSB302 internally controls the PDWN1, PDWN2, PU_EN1 and PU_EN2, MEAS_CC1 and MEAS_CC2 and implements a fixed DRP toggle between presenting as a SRC and presenting as a SNK. Alternately, it can present as a SRC or SNK only and poll CC1 and CC2 continuously.

Table 1. Processor Configures the FUSB302through I2C:					
I ² C Registers / Bits	Value				
TOGGLE	1				
PWR	07H				
HOST_CUR0	1				
HOST_CUR1	0				
MEAS_VBUS	0				
VCONN_CC1	0				
VCONN_CC2	0				
Mask Register	0xFE				
Maska Register	0xBF				
Maskb Register (Except I_TOGDONE and I_BC_LVL Interrupt)	0x01				
PWR[3:0]	0x07				

Notes:

1. Once it has been determined what the role is of the FUSB302, it returns I_TOGDONE and TOGSS1/2.

2. Processor then can perform a final manual check through I2C.

Manual Device Toggle

The FUSB302 has the capability to do manual DRP toggle. In manual toggle the FUSB302 is configurable by the processor software by I2C and setting TOGGLE = 0.

Manual Device Detection and Configuration

A Type-C device must monitor VBUS to determine if it is attached or detached. The FUSB302 provides this information through the VBUSOK interrupt. After the Type-C device knows that a Type-C host has been attached, it needs to determine what type of termination is applied to each CC pin. The software determines if an Ra or Rd termination is present based on the BC_LVL and COMP interrupt and status bits.

Additionally, for Rd terminations, the software can further determine what charging current is allowed by the Type-C host by reading the BC_LVL status bits. This is summarized in Table 2.

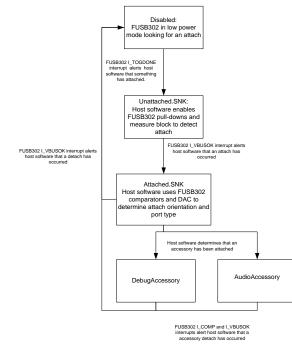

Toggle Functionality

When TOGGLE bit (Control2 register) is set the FUSB302 implements a fixed DRP toggle between presenting as a SRC and as a SNK. It can also be configured to present as a SRC only or SNK only and poll CC1 and CC2 continuously. This operation is turned on with TOGGLE=1 and the processor should initially write HOST_CUR1=0, HOST_CUR0=1 (for default current), VCONN_CC1=VCONN_CC2=0, Mask Register=0xFE, Maska register=0xBF, and Maskb register=0x01, and PWR=0x01. The processor should also read the interrupt register to clear them prior to setting the TOGGLE bit.

Status Type		Interru	Mooning		
Status Type	BC_LVL[1:0]	COMP	COMP Setting	VBUSOK	Meaning
	2'b00	NA	NA	1	vRA
	2'b01	NA	NA	1	vRd-Connect and vRd-USB
	2'b10	NA	NA	1	vRd-Connect and vRd-1.5
CC Detection	2'b11	0	6'b11_0100 (2.226 V)	1	vRd-Connect and vRd-3.0
Attach	NA	NA	NA	1	Host Attached, VBUS Valid
Detach	NA	NA	NA	0	Host Detached, VBUS Invalid

Table 2. Device Interrupt Summary

The high level software flow diagram for a Type-C device (SNK) is shown in Figure 7.

Manual Host Detection and Configuration

When the FUSB302 is configured as a Type-C host, the software can use the status of the comparators and DAC to determine when a Type-C device has been attached or detached and what termination type has been attached to each CC pin.

Table 3. Host Interrup	t Summary
------------------------	-----------

The FUSB302 allows the host software to change the charging current capabilities of the port through the HOST_CUR control bits. If the HOST_CUR bits are changed prior to attach, the FUSB302 automatically indicates the programmed current capabilities are changed after a device is attached. If the current capabilities are changed after a device is attached, the FUSB302 immediately changes the CC line to the programmed capability.

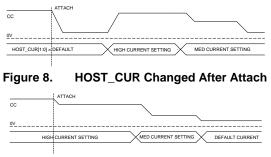

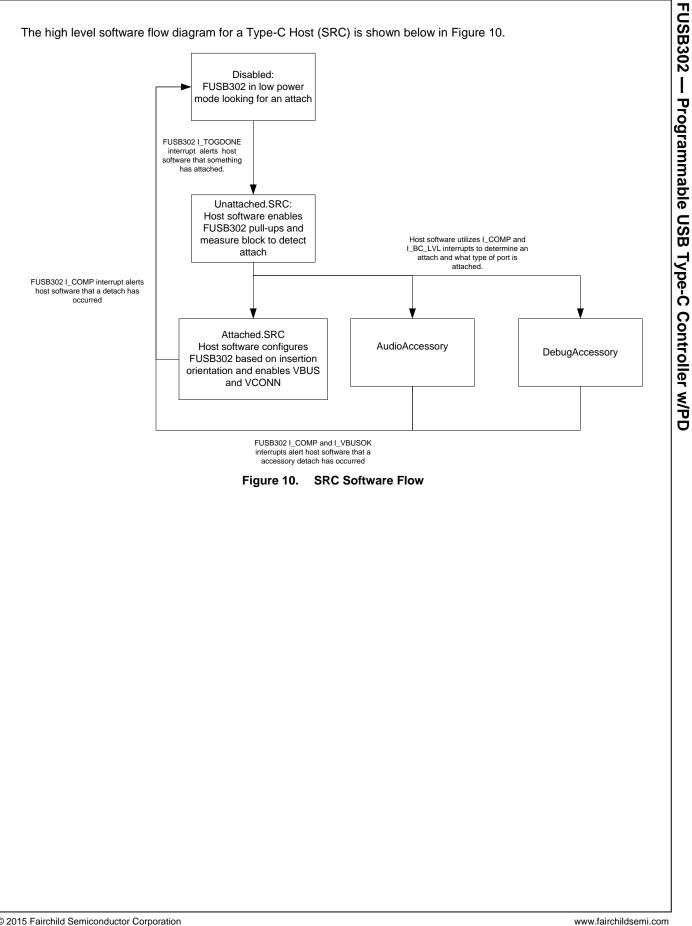

Figure 9. HOST_CUR Changed Prior To Attach

The Type-C specification outlines different attach and detach thresholds for a Type-C host that are based on how much current is supplied to each CC pin. Based on the programmed HOST_CUR setting, the software adjusts the DAC comparator threshold to match the Type-C specification requirements. The BC_LVL comparators can also be used as part of the Ra detection flow. This is summarized in Table 3.

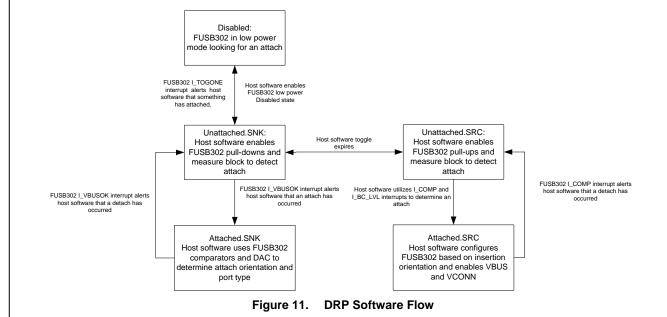

Torrain etion		Ir	Interrupt Status				
Termination	HOST_CUR[1:0]	BC_LVL[1:0]	COMP	COMP Setting	Attach/Detach		
	2'b01	2'b00	NA	NA			
Ra	2'b10	2'b01	0	6'b00_1001 (0.42 V)	NA		
	2'b11	2'b10	0	6'b01_0010 (0.8 V)			
	21601 21610	NA	0	6'b10_0101 (1.6 V)	Attach		
Rd	2'b01, 2'b10	NA	1	6'b10_0101 (1.6 V)	Detach		
ĸu		NA	0	6'b11_1101 (2.6 V)	Attach		
	2'b11	NA	1	6'b11_1101 (2.6 V)	Detach		

Manual Dual-Role Detection and Configuration

The Type-C specification allows ports to be both a device and a host depending on what type of port has attached. This functionality is similar to USB OTG ports with the current USB connectors and is called a dual-

role port. The FUSB302 can be used to implement a dual-role port. A Type-C dual role port toggles between presenting as a Type-C device and a Type-C host. The host software controls the toggle time and configuration of the FUSB302 in each state as shown in Figure 11.

BMC Power Delivery

The Type-C connector allows USB Power Delivery (PD) to be communicated over the connected CC pin between two ports. The communication method is the BMC Power Delivery protocol and is used for many different reasons with the Type-C connector. Possible uses are outlined below.

- Negotiating and controlling charging power levels
- Alternative Interfaces such as MHL, Display Port
- Vendor specific interfaces for use with custom docks or accessories
- Role swap for dual-role ports that want to switch who is the host or device
- Communication with USB3.1 full featured cables

The FUSB302 integrates a thin BMC PD client which includes the BMC physical layer and packet FIFOs (48 bytes for transmit and 80 bytes for receive) which allows packets to be sent and received by the host software through I2C accesses. The FUSB302 allows host software to implement all features of USB BMC PD through writes and reads of the FIFO and control of the FUSB302 physical interface.

The FUSB302 uses tokens to control the transmission of BMC PD packets. These tokens are written to the transmit FIFO and control how the packet is transmitted on the CC pin. The tokens are designed to be flexible and support all aspects of the USB PD specification. The FUSB302 additionally enables control of the BMC transmitter through tokens. The transmitter can be enabled or disabled by specific token writes which allow faster packet processing by burst writing the FIFO with all the information required to transmit a packet.

The FUSB302 receiver stores the received data and the received CRC in the receive FIFO when a valid packet is received on the CC pin. The BMC receiver automatically enables the internal oscillator when activity is sensed on the CC pin and load the FIFO when a packet is received. The I_ACTIVITY and I_CRC_CHK interrupts alert the host software that a valid packet was received.

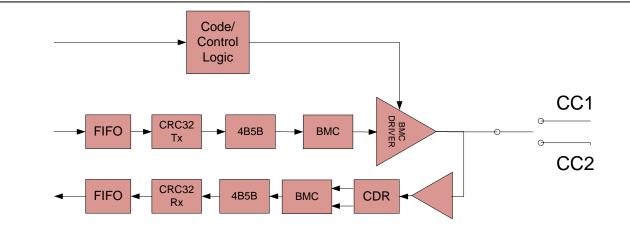

Figure 12. USB BMC Power Delivery Blocks

Power Level Determination

The Type-C specification outlines the order of precedence for power level determination which covers power levels from basic USB2.0 levels to the highest levels of USB PD. The host software is expected to follow the USB Type-C specification for charging current priority based on feedback from the FUSB302 detection, external BC1.2 detection and any USB Power Delivery communication.

The FUSB302 does not integrate BC1.2 charger detection which is assumed available in the USB transceiver or USB charger in the system.

Power Up, Initialization and Reset

When power is first applied through VDD, the FUSB302 is reset and registers are initialized to the default values shown in the register map.

The FUSB302 can be reset through software by programming the SW_RES bit in the RESET register.

If no power applied to VDD then the SRC can recognize the FUSB302 as a SNK.

PD Automatic Receive GoodCRC

The power delivery packets require a GoodCRC acknowledge packet to be sent for each received packet where the calculated CRC is the correct value. This calculation is done by the FUSB302 and triggers the I_CRC_CHK interrupt if the CRC is good. If the AUTO_CRC (Switches1 register bit) is set and AUTO_PRE=0, then the FUSB302 will automatically send the GoodCRC control packet in response to alleviate the local processor from responding quickly to the received packet. If GoodCRC is required for anything beyond SOP, then enable SOP*.

PD Send

The FUSB302 implements part of the PD protocol layer for sending packets in an autonomous fashion.

PD Automatic Sending Retries

If GoodCRC packet is not received and AUTO_RETRY is set, then a retry of the same message that was in the TxFIFO written by the processor is executed within tRetry and that is repeated for NRETRY times.

PD Send Soft Reset

If the correct GoodCRC packet is still not received for all retries then I_RETRYFAIL interrupt is triggered and if AUTO_SOFT_RESET is set, then a Soft Reset packet is created (MessageID is set to 0 and the processor upon servicing I_RETRYFAIL would set the true MessageIDCounter to 0.

If this Soft Reset is sent successfully where a GoodCRC control packet is received with a MessageID=0 then I_TXSENT interrupt occurs.

If not, this Soft Reset packet is retried NRETRIES times (MessageID is always 0 for all retries) if a GoodCRC acknowledge packet is not received with CRCReceiveTimer expiring (tReceive of 1.1 ms max). If all retries fail, then I_SOFTFAIL interrupt is triggered.

PD Send Hard Reset

If all retries of the soft reset packet fail and if AUTO_HARD_RESET is set, then a hard reset ordered set is sent by loading up the TxFIFO with RESET1, RESET1, RESET1, RESET2 and sending a hard reset. Note only one hard reset is sent since the typical retry mechanism doesn't apply. The processor's policy engine firmware is responsible for retrying the hard reset is it doesn't receive the required response.

FUSB302 — Programmable USB Type-C Controller w/PD

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameter				Max.	Unit

USB PD Specific Parameters

Symbol	Parameter	$T_A = -4$ $T_J = -4$	Unit		
-		Min. Typ. Max.			
tHardReset	If a Soft Reset message fails, a Hard Reset is sent after tHardReset of CRCReceiveTimer expiring			5	ms
tHardReset Complete	If the FUSB302 cannot send a Hard Reset within tHardResetComplete time because of a busy line, then a I_HARDFAIL interrupt is triggered			5	ms
tReceive	This is the value for which the CRCReceiveTimer expires. The CRCReceiveTimer is started upon the last bit of the EOP of the transmitted packet	0.9		1.1	ms
tRetry	Once the CRCReceiveTimer expires, a retry packet has to be sent out within tRetry time. This time is hard to separate externally from tReceive since they both happen sequentially with no visible difference in the CC output			75	μs
tSoftReset	If a GoodCRC packet is not received within tReceive for NRETRIES then a Soft Reset packet is sent within tSoftReset time.			5	ms
tTransmit	From receiving a packet, we have to send a GoodCRC in response within tTransmit time. It is measured from the last bit of the EOP of the received packet to the first bit sent of the preamble of the GoodCRC packet			195	μs

Type: Read

Bit #	Name	R/W/C	Size (Bits)	Description	
7	RXSOP2	R	1	1: Indicates the last packet placed in the RxFIFO is type SOP" (SOP double prime).	
6	RXSOP1	R	1	1: Indicates the last packet placed in the RxFIFO is type SOP' (SOP prime).	
5	RX_EMPTY	R	1	1: The receive FIFO is empty.	
4	RX_FULL	R	1	1: The receive FIFO is full.	
3	TX_EMPTY	R	1	1: The transmit FIFO is empty.	
2	TX_FULL	R	1	1: The transmit FIFO is full.	
1	OVRTEMP	R	1	1: Temperature of the device is too high.	
0	OCP	R	1	1: Indicates an over-current or short condition has occurred on the VCONN switch.	

Table 27. Interrupt

Address: 42h Reset Value: 0x0000_0000

Type: Read/Clear

Bit #	Name	R/W/C	Size (Bits)	Description	
7	I_VBUSOK	R/C	1	1: Interrupt occurs when VBUS transitions through 4.5 V. This bit typically is used to recognize port partner during startup.	
6	I_ACTIVITY	R/C	1	1: A change in the value of ACTIVITY of the CC bus has occurred.	
5	I_COMP_CHNG	R/C	1	1: A change in the value of COMP has occurred. Indicates selected CC line has tripped a threshold programmed into the MDAC.	
4	I_CRC_CHK	R/C	1	1: The value of CRC_CHK newly valid. I.e. The validity of the incoming packet has been checked.	
3	I_ALERT	R/C	1	1: Alert software an error condition has occurred. An alert is caused by: TX_FULL: the transmit FIFO is full. RX_FULL: the receive FIFO is full. See Status1 bits.	
2	I_WAKE	R/C	1	1: Voltage on CC indicated a device attempting to attach. Software must then power up the clock and receiver blocks.	
1	I_COLLISION	R/C	1	1: When a transmit was attempted, activity was detected on the active CC line. Transmit is not done. The packet is received normally.	
0	I_BC_LVL	R/C	1	1: A change in host requested current level has occurred.	

Table 28. FIFOs

Address: 43h

Reset Value: 0x0000_0000

Type: (see column below)

Bit #	Name	R/W/C	Size (Bits)	Description
7:0	TX/RX Token	Read or Write	8	Writing to this register writes a byte into the transmit FIFO. Reading from this register reads from the receive FIFO. Each byte is a coded token. Or a token followed by a fixed number of packed data byte (see token coding in Table 29).

Software Model

Port software interacts with the port chip in two primary ways:

- I²C Registers
- 8 bit data tokens sent to or received from the FIFO register.
- All reserved bits written in the TxFIFO should be 0 and all reserved bit read from the RxFIFO should be ignored.

Table 29. Tokens Used in FIFO

Transmit Data Tokens

Transmit data tokens provide in-sequence transmit control and data for the transmit logic. Note that the token codes, and their equivalent USB PD K-Code are not the same. Tokens are read one at a time when they reach the end of the TX FIFO. I.e., the specified token action is performed before the next token is read from the TX FIFO.

The tokens are defined as follows:

Code	Name	Size (Bytes)	Description			
101x-xxx1 (0xA1)	TXON	1	Alternative method for starting the transmitter with the TX-START bit. This is not a token written to the TxFIFO but a command much like TX_START but it is more convenient to write it while writing to the TxFIFO in one contiguous write operation. It is preferred that the TxFIFO is first written with data and then TXON or TX_START is executed. It is expected that A1h will be written for TXON not any other bits where x is non-zero such as B1h, BFh, etc			
0x12	SOP1	1	When reaching the end of the FIFO causes a Sync-1 symbol to be transmitted.			
0x13	SOP2	1	When reaching the end of the FIFO causes a Sync-2 symbol to be transmitted.			
0x1B	SOP3	1	When reaching the end of the FIFO causes a Sync-3 symbol to be transmitted.			
0x15	RESET1	1	When reaching the end of the FIFO causes a RST-1 symbol to be transmitted.			
0x16	RESET2	1	When reaching the end of the FIFO causes a RST-2 symbol to be transmitted.			
0x80	PACKSYM	1+N	This data token must be immediately followed by a sequence of N packed data bytes. This token is defined by the 3 MSB's being set to 3'b100. The 5 LSB's are the number of packed bytes being sent. Note: N cannot be less than 2 since the minimum control packet has a header that is 2 bytes and N cannot be greater than 30 since the maximum data packet has 30 bytes (2 byte header + 7 data objects each having 4 bytes)			
			Packed data bytes have two 4 bit data fields. The 4 LSB's are sent first, after 4b5b conversion etc in the chip.			
0xFF	JAM_CRC	1	Causes the CRC, calculated by the hardware, to be inserted into the transmit stream when this token reaches the end of the TX FIFO.			
0x14	EOP	1	Causes an EOP symbol to be sent when this token reaches the end of the TX FIFO.			
0xFE	TXOFF	1	Turn off the transmit driver. Typically the next symbol after EOP.			

Receive Data Tokens

Receive data tokens provide in-sequence receive control and data for the receive logic. The RxFIFO can absorb as many packets as the number of bytes in the RxFIFO (80 bytes). The tokens are defined as follows:

Table 30. To	okens Used	in RxFIFO
--------------	------------	-----------

Code (in binary)	Name	Size (Bytes)	Description	
111b_bbbb	SOP	1	First byte of a received packet to indicate that the packet is an SOP packet ("b" is undefined and can be any bit)	
110b_bbbb	SOP1	1	First byte of a received packet to indicate that the packet is an SOP' packet and occurs only if ENSOP1=1 ("b" is undefined and can be any bit)	
101b_bbbb	SOP2	1	First byte of a received packet to indicate that the packet is an SOP" packet and occurs only if ENSOP2=1 ("b" is undefined and can be any bit)	
100b_bbbb	SOP1DB	1	First byte of a received packet to indicate that the packet is an SOP'_DEBUG packet and occurs only if ENSOP1DB=1 ("b" is undefined and can be any bit)	
		First byte of a received packet to indicate that the packet is an SOP"_DEBUG packet and occurs only if ENSOP2DB=1 ("b" is undefined and can be any bit)		
010b_bbbb / 001b_bbbb / 000b_bbbb	Do Not Use	1	These can be used in future versions of this device and should not be relied on to be any special value. ("b" is undefined and can be any bit)
