## CAT5120, CAT5121, CAT5122

## 16-tap Digital <br> Potentiometers (POTs) with 2-wire Interface

## Description

CAT5120/5121/5122 linear-taper digital POTs perform the same function as a mechanical potentiometer or a variable resistor. These devices consist of a fixed resistor and a wiper contact with 16-tap points that are digitally controlled through a 2 -wire up/down serial interface.

The CAT5120 is configured as a potentiometer. The CAT5121 and CAT5122 are configured as variable resistors. See Pin Configurations for part functionality.

Two resistance values are available: $10 \mathrm{k} \Omega$ and $50 \mathrm{k} \Omega$. These are available in space-saving 5 -pin and 6 -pin SC-70 and SOT-23 packages.

## Features

- $0.3 \mu \mathrm{~A}$ Ultra-low Standby Current
- Single-supply Operation: 2.7 V to 5.5 V
- Glitchless Switching between Resistor Taps
- Power-on Reset to Midscale
- 2-wire Up/Down Serial Interface
- Resistance Values: $10 \mathrm{k} \Omega, 50 \mathrm{k} \Omega$
- Available in SC-70 and SOT-23 Packages
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

## Applications

- LCD Screen Adjustment
- Volume Control
- Mechanical Potentiometer Replacement
- Gain Adjustment
- Line Impedance Matching

Figure 6. Tap-to-Tap Switching Transient

## CAT5120, CAT5121, CAT5122

## FUNCTIONAL DESCRIPTION

The CAT5120/5121/5122 consist of a fixed resistor and a wiper contact with 16-tap points that are digitally controlled through a 2-wire up/down serial interface. Two end-to-end resistance values are available: $10 \mathrm{k} \Omega$ and $50 \mathrm{k} \Omega$.

The CAT5120 is designed to operate as a potentiometer. In this configuration, the low terminal of the resistor array is connected to ground (pin 2).

The CAT5122 performs as a variable resistor. In this device, the wiper terminal and high terminal of the resistor array is connected at pin 5. The CAT5121 is a similar variable resistor, except the low terminal is connected to pin 5.

## Digital Interface Operation

The devices have two modes of operation when the serial interface is active: increment and decrement mode. The serial interface is only active when $\overline{\mathrm{CS}}$ is low.

The $\overline{\mathrm{CS}}$ and U/D inputs control the position of the wiper along the resistor array. When $\overline{\mathrm{CS}}$ transitions from high to
low, the part will go into increment mode if $U / \bar{D}$ input is high, and into decrement mode when $U / \overline{\mathrm{D}}$ input is low. Once the mode is set, the device will remain in that mode until $\overline{\mathrm{CS}}$ goes high again. A low-to-high transition at the $U / \overline{\mathrm{D}}$ pin will increment or decrement the wiper position depending on the current mode (Figures 7 and 8).

When the $\overline{\mathrm{CS}}$ input transitions to high (serial interface inactive), the value of the counter is stored and the wiper position is maintained.
Note that when the wiper reaches the maximum (or minimum) tap position, the wiper will not wrap around to the minimum (or maximum) position.

## Power-on Reset

All parts in this family feature power-on reset (POR) circuitry that sets the wiper position to midscale at power-up. By default, the chip is in the increment mode.

Note: "W" is not a digital signal. It represents wiper transitions.
Figure 7. Serial Interface Timing Diagram, Increment Mode

Note: "W" is not a digital signal. It represents wiper transitions.
Figure 8. Serial Interface Timing Diagram, Decrement Mode

## CAT5120, CAT5121, CAT5122

## APPLICATIONS INFORMATION

The devices are intended for circuits requiring digitally controlled adjustable resistance, such as LCD contrast control, where voltage biasing adjusts the display contrast.

## Alternative Positive LCD Bias Control

Use an op amp to provide buffering and gain on the output of the CAT5120. Connect the mechanical potentiometer to the positive input of a noninverting op amp (Figure 9) to select a portion of the input signal by digitally controlling the wiper terminal. Figure 10 shows a similar circuit for the CAT5121.

Figure 9. Positive LCD Bias Control

Figure 11. Adjustable Gain Circuit

## Adjustable Gain

Figures 11 and 12 show how to use the variable resistor to digitally adjust the gain of a noninverting op amp configuration. Connect the CAT5121 in series with a resistor to ground to form the adjustable gain control of a noninverting amplifier. The devices have a low $5 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$ ratiometric tempco that allows for a very stable adjustable gain configuration over temperature.
