LC87F1JJ2A — 8-bit 1-chip Microcontroller with USB-host controller

Overview

The LC87F1JJ2A is an 8-bit microcomputer that, integrates on a single chip a number of hardware features such as 192K-byte flash ROM, 16384-byte RAM, an on-chip debugger, a 16-bit timer/counter, a 16-bit timer, four 8-bit timers, a base timer serving as a realtime clock, 3 channels of synchronous SIO interface with automatic data transfer capabilities, an asynchronous/synchronous SIO interface, a UART interface, a full-speed USB interface (host control function), a 12-channel AD converter, 2 channels of 12-bit PWM, a system clock frequency divider, an infrared remote control receiver circuit, and an interrupt feature.

Features

■Flash ROM

- 196608 × 8 bits
- Capable of on-board programming with a wide range of supply voltages: 3.0 to 5.5V
- Block-erasable in 128 byte units
- Writes data in 2-byte units

■RAM

- 16384 × 9 bits

■Package Form

- SQFP48(7×7): Lead-/Halogen-free type

* This product is licensed from Silicon Storage Technology, Inc. (USA), and manufactured and sold by SANYO Semiconductor Co., Ltd.

Package Dimensions

unit : mm (typ) 3163B

■ Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications of our customer who is considering such use and/or outside the scope of our intended standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.

■ Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

SANYO Semiconductor Co., Ltd.

LC87F1JJ2A

■ Bus Cycle Time

- 83.3ns (When CF=12MHz)

Note: The bus cycle time here refers to the ROM read speed.

■ Minimum Instruction Cycle Time (tCYC)

- 250ns (When CF=12MHz)

■ Ports

- I/O ports

Ports whose I/O direction can be designated in 1-bit units 28 (P10 to P17, P20 to P27, P30 to P34, P70 to P73, PWM0, PWM1, XT2)

Ports whose I/O direction can be designated in 4-bit units 8 (P00 to P07)

- USB ports 2 (UHD+, UHD-)
- Dedicated oscillator ports 2 (CF1, CF2)
- Input-only port (also used for oscillation) 1 (XT1)
- Reset pin 1 (RES)
- Power supply pins 6 (VSS1 to VSS3, VDD1 to VDD3)

■ Timers

- Timer 0: 16-bit timer/counter with 2 capture registers.

Mode 0: 8-bit timer with an 8-bit programmable prescaler (with two 8-bit capture registers) × 2 channels

Mode 1: 8-bit timer with an 8-bit programmable prescaler (with two 8-bit capture registers) + 8-bit counter (with two 8-bit capture registers)

Mode 2: 16-bit timer with an 8-bit programmable prescaler (with two 16-bit capture registers)

Mode 3: 16-bit counter (with two 16-bit capture registers)

- Timer 1: 16-bit timer/counter that supports PWM/toggle outputs

Mode 0: 8-bit timer with an 8-bit prescaler (with toggle outputs) + 8-bit timer/counter with an 8-bit prescaler (with toggle outputs)

Mode 1: 8-bit PWM with an 8-bit prescaler × 2 channels

Mode 2: 16-bit timer/counter with an 8-bit prescaler (with toggle outputs) (toggle outputs also possible from lower-order 8 bits)

Mode 3: 16-bit timer with an 8-bit prescaler (with toggle outputs) (lower-order 8 bits may be used as PWM outputs)

- Timer 4: 8-bit timer with a 6-bit prescaler
- Timer 5: 8-bit timer with a 6-bit prescaler
- Timer 6: 8-bit timer with a 6-bit prescaler (with toggle outputs)
- Timer 7: 8-bit timer with a 6-bit prescaler (with toggle outputs)
- Base timer

1) The clock is selectable from the subclock (32.768kHz crystal oscillation), system clock, and timer 0 prescaler output.

2) Interrupts programmable in 5 different time schemes

■ SIO

- SIO0: Synchronous serial interface

1) LSB first/MSB first mode selectable

2) Transfer clock cycle: 4/3 to 512/3 tCYC

3) Automatic continuous data transmission (1 to 256 bits, specifiable in 1-bit units) (Suspension and resumption of data transmission possible in 1 byte units)

- SIO1: 8-bit asynchronous/synchronous serial interface

Mode 0: Synchronous 8-bit serial I/O (2- or 3-wire configuration, 2 to 512 tCYC transfer clocks)

Mode 1: Asynchronous serial I/O (half-duplex, 8 data bits, 1 stop bit, 8 to 2048 tCYC baudrates)

Mode 2: Bus mode 1 (start bit, 8 data bits, 2 to 512 tCYC transfer clocks)

Mode 3: Bus mode 2 (start detect, 8 data bits, stop detect)

- SIO4: Synchronous serial interface

1) LSB first/MSB first mode selectable

2) Transfer clock cycle: 4/3 to 1020/3 tCYC

3) Automatic continuous data transmission (1 to 8192 bytes, specifiable in 1 byte units) (Suspension and resumption of data transmission possible in 1 byte units or in word units)

4) Auto-start-on-falling-edge function

5) Clock polarity selectable

6) CRC16 calculator circuit built in

- SIO9: Synchronous serial interface
 - 1) LSB first/MSB first mode selectable
 - 2) Transfer clock cycle: 4/3 to 1020/3 tCYC
 - 3) Automatic continuous data transmission (1 to 8192 bytes, specifiable in 1 byte units)
(Suspension and resumption of data transmission possible in 1 byte units or word units)
 - 4) Auto-start-on-falling-edge function
 - 5) Clock polarity selectable
 - 6) CRC16 calculator circuit built in

■ Full Duplex UART

- 1) Data length: 7/8/9 bits selectable
- 2) Stop bits: 1 bit (2 bits in continuous transmission mode)
- 3) Baud rate: 16/3 to 8192/3 tCYC

■ AD Converter: 8 bits × 12 channels

■ PWM: Multifrequency 12-bit PWM × 2 channels

■ Infrared Remote Control Receiver Circuit

- 1) Noise rejection function (noise filter time constant: Approx. 120μs when the 32.768kHz crystal oscillator is selected as the base clock)
- 2) Supports data encoding systems such as PPM (Pulse Position Modulation) and Manchester encoding.
- 3) X'tal HOLD mode release function

■ USB Interface (host control function)

- 1) Compliant with full-speed (12M bps) specifications
- 2) Supports 4 transfer types (control transfer, bulk transfer, interrupt transfer, and isochronous transfer).

■ Audio Interface

- 1) Sampling frequency (fs): 8kHz/11.025kHz/12kHz/16kHz/22.05kHz/24kHz/32kHz/44.1kHz/48kHz
- 2) Master clock frequency: 256fs/384fs
- 3) Bit clock selectable: 48fs/64fs
- 4) Data bit length: 16/18/20/24 bits
- 5) LSB first/MSB first mode selectable
- 6) Left-justification/right-justification/I2S format selectable

■ Watchdog Timer

- Watchdog timer using external RC circuitry
- Interrupt and reset signals selectable

■ Clock Output Function

- 1) Can output a clock with a clock rate of 1/1, 1/2, 1/4, 1/8, 1/16, 1/32, or 1/64 of the source oscillator clock selected as the system clock.
- 2) Can output the source oscillation clock for the subclock.

LC87F1JJ2A

■ Interrupts

- 41 sources, 10 vector addresses

- 1) Provides three levels (low (L), high (H), and highest (X)) of multiplex interrupt control. Any interrupt requests of the level equal to or lower than the current interrupt are not accepted.
- 2) When interrupt requests to two or more vector addresses occur at the same time, the interrupt of the highest level takes precedence over the other interrupts. For interrupts of the same level, the interrupt into the smallest vector address takes precedence.

No.	Vector Address	Level	Interrupt Source
1	00003H	X or L	INT0
2	0000BH	X or L	INT1
3	00013H	H or L	INT2/T0L/INT4/UHC bus active/remote control signal receive
4	0001BH	H or L	INT3/INT5/base timer
5	00023H	H or L	T0H/INT6/UHC device attach/UHC device detach/UHC resume
6	0002BH	H or L	T1L/T1H/INT7/SIO9/AIF start
7	00033H	H or L	SIO0/UART1 receive
8	0003BH	H or L	SIO1/SIO4/UART1 transmit/AIF end
9	00043H	H or L	ADC/T6/T7/UHC-ACK/UHC-NAK/UHC error/UHC-STALL
10	0004BH	H or L	Port 0/PWM0/PWM1/T4/T5/UHC-SOF/DMCOPY/AIF error

- Priority levels $X > H > L$
- Of interrupts of the same level, the one with the smallest vector address takes precedence.

■ Subroutine Stack Levels: 8192 levels maximum (The stack is allocated in RAM.)

■ High-speed Multiplication/Division Instructions

- 16 bits \times 8 bits (5 tCYC execution time)
- 24 bits \times 16 bits (12 tCYC execution time)
- 16 bits \div 8 bits (8 tCYC execution time)
- 24 bits \div 16 bits (12 tCYC execution time)

■ Oscillation and PLL Circuits

- RC oscillation circuit (internal): For system clock
- CF oscillation circuit: For system clock
- Crystal oscillation circuit: For system clock, and realtime clock
- PLL circuit (internal): For USB interface (see Fig.5) and audio interface (see Fig. 6)

LC87F1JJ2A

■ Standby Function

- HALT mode: Halts instruction execution while allowing the peripheral circuits to continue operation.
 - 1) Oscillation is not halted automatically.
 - 2) There are three ways of releasing the HALT mode.
 - (1) Setting the reset pin to the lower level.
 - (2) System resetting by watchdog timer
 - (3) Generating an interrupt
- HOLD mode: Suspends instruction execution and the operation of the peripheral circuits.
 - 1) The PLL base clock generator, CF, RC and crystal oscillators automatically stop operation.
 - 2) There are five ways of releasing the HOLD mode.
 - (1) Setting the reset pin to the lower level
 - (2) System resetting by watchdog timer
 - (3) Having an interrupt source established at one of the INT0, INT1, INT2, INT4, and INT5 pins
 - * The INT0 and INT1 pins must be configured only for level detection.
 - (4) Having an interrupt source established at port 0
 - (5) Having an bus active interrupt source established in the USB host control circuit
- X'tal HOLD mode: Suspends instruction execution and the operation of the peripheral circuits except the base timer.
 - 1) The PLL base clock generator, CF and RC oscillator automatically stop operation.
 - 2) The state of crystal oscillation established when the X'tal HOLD mode is entered is retained.
 - 3) There are seven ways of releasing the X'tal HOLD mode.
 - (1) Setting the reset pin to the low level
 - (2) System resetting by watchdog timer
 - (3) Having an interrupt source established at one of the INT0, INT1, INT2, INT4, and INT5 pins
 - * The INT0 and INT1 pins must be configured only for level detection.
 - (4) Having an interrupt source established at port 0
 - (5) Having an interrupt source established in the base timer circuit
 - (6) Having an bus active interrupt source established in the USB host control circuit
 - (7) Having an interrupt source established in the infrared remote controller receiver circuit

■ Development Tools

- On-chip debugger: TCB87- type B + LC87F1JJ2A

■ Flash ROM Programming Boards

Package	Programming board
SQFP48(7×7)	W87F55256SQ

■ Flash ROM Programmer

Maker		Model	Supported Version	Device
Flash Support Group, Inc. (FSG)	Single	AF9708/ AF9709/AF9709B/AF9709C (including Ando Electric Co., Ltd. models)	Rev. 03.12 or later	LC87F1JJ2A
	Onboard single/ganged	AF9101/AF9103(main unit) (FSG)	(Note 2)	LC87F1JJ2A
Flash Support Group, Inc. (FSG) + SANYO(Note 1)	SIB87(interface driver) (SANYO)			
SANYO	Single/ganged	SKK/SKK Type B (SANYO FWS)	Application version: 1.04 or later Chip data version: 2.17 or later	LC87F1JJ2
	Onboard single/ganged	SKK-DBG Type B (SANYO FWS)		

Note 1: PC-less standalone onboard programming is possible using the FSG onboard programmer (AF9101/AF9103) and the serial interface driver (SIB87) provided by SANYO in pair.

Note 2: Dedicated programming device and program are required depending on the programming conditions. Contact SANYO or FSG if you have any questions or difficulties regarding this matter.

Port Output Types

The table below lists the types of port outputs and the presence/absence of a pull-up resistor.

Data can be read into any input port even if it is in the output mode.

Port Name	Option Selected in Units of	Option Type	Output Type	Pull-up Resistor
P00 to P07	1 bit	1	CMOS	Programmable (Note 1)
		2	Nch-open drain	No
P10 to P17 P20 to P27 P30 to P34	1 bit	1	CMOS	Programmable
		2	Nch-open drain	Programmable
P70	-	No	Nch-open drain	Programmable
P71 to P73	-	No	CMOS	Programmable
PWM0, PWM1	-	No	CMOS	No
UHD+, UHD-	-	No	CMOS	No
XT1	-	No	Input only	No
XT2	-	No	32.768kHz crystal resonator output (Nch-open drain when in general-purpose output mode)	No

Note 1: Programmable pull-up resistors for port 0 are controlled in 4 bit units (P00 to 03, P04 to 07).

LC87F1JJ2A

User Options

Option Name	Type	Flash ROM Version	Option Selected in Units of	Setting
Port output type	P00 to P07	○	1 bit	CMOS
				Nch-open drain
	P10 to P17	○	1 bit	CMOS
				Nch-open drain
	P20 to P27	○	1 bit	CMOS
				Nch-open drain
	P30 to P34	○	1 bit	CMOS
				Nch-open drain
Program start address	-	○	-	00000h
				1FE00h
USB Regulator	USB Regulator	○	-	Use
				Nonuse
	USB Regulator (at HOLD mode)	○	-	Use
				Nonuse
	USB Regulator (at HALT mode)	○	-	Use
				Nonuse

Power Pin Treatment

Connect the IC as shown below to minimize the noise input to the V_{DD1} pin and extend the backup period. Be sure to electrically short the V_{SS1} , V_{SS2} , and V_{SS3} pins.

Example 1: When the microcontroller is in the backup state in the HOLD mode, the power to sustain the high level of output ports is supplied by their backup capacitors.

Example 2: The high level output at ports is not sustained and unstable in the HOLD backup mode.

USB Reference Power Option

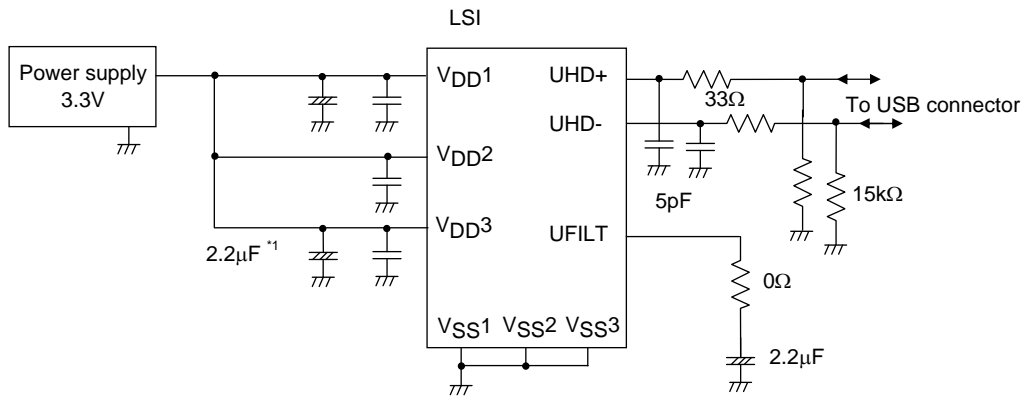

When a voltage 4.5 to 5.5V is supplied to V_{DD1} and the internal USB reference voltage circuit is activated, the reference voltage for USB port output is generated. The active/inactive state of the reference voltage circuit can be switched by optional settings. The procedure for marking the optional settings is described below.

		(1)	(2)	(3)	(4)
Option settings	USB regulator	Use	Use	Use	Nonuse
	USB regulator in HOLD mode	Use	Nonuse	Nonuse	Nonuse
	USB regulator in HALT mode	Use	Nonuse	Use	Nonuse
Reference voltage circuit state	Normal mode	Active	Active	Active	Inactive
	HOLD mode	Active	Inactive	Inactive	Inactive
	HALT mode	Active	Inactive	Active	Inactive

- When the USB reference voltage circuit is made inactive, the level of the reference voltage for USB port output is equal to V_{DD1}.
- Selection (2) or (3) can be used to set the reference voltage circuit inactive in HOLD or HALT mode.
- When the reference voltage circuit is activated, the current drain increases by approximately 100μA compared with when the reference voltage circuit is inactive.

Circuit example 1: When V_{DD1}=V_{DD2}=3.3V

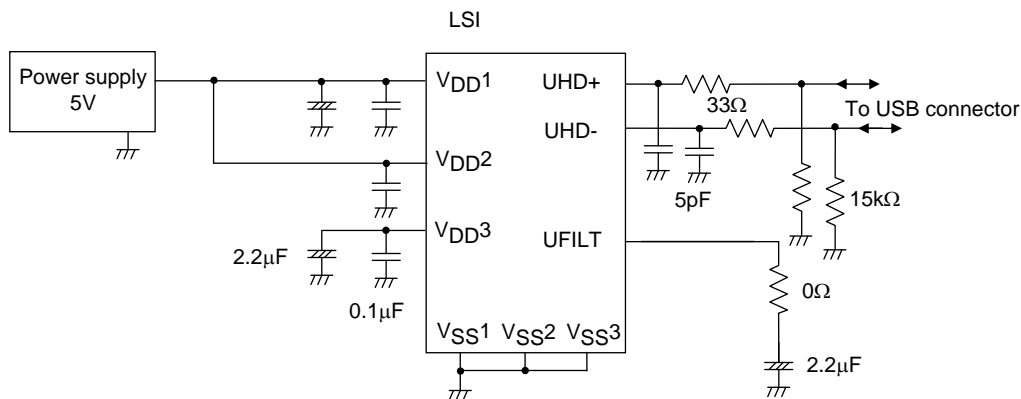

- Inactivating the reference voltage circuit (selection (4)).
- Connecting V_{DD3} to V_{DD1} and V_{DD2}.

*1: Needs adjustment on target board.

Circuit example 2: When V_{DD1}=V_{DD2}=5.0V

- Activating the reference voltage circuit (selection (1)).
- Isolating V_{DD3} from V_{DD1} and V_{DD2}, and connecting capacitor between V_{DD3} and V_{SS}.

AD Converter Characteristics at Ta = -40°C to +85°C, VSS1 = VSS2 = VSS3 = 0V

Parameter	Symbol	Pin/Remarks	Conditions	Specification				
				VDD[V]	min	typ	max	unit
Resolution	N	AN0(P00) to		3.0 to 5.5		8		bit
Absolute accuracy	ET	AN7(P07), AN8(P70), AN9(P71), AN10(XT1), AN11(XT2)	(Note 6-1)	3.0 to 5.5			±1.5	LSB
Conversion time	TCAD		AD conversion time=32×tCYC (when ADCR2=0) (Note 6-2)	4.5 to 5.5	15.68 (tCYC= 0.490μs)		97.92 (tCYC= 3.06μs)	μs
				3.0 to 5.5	23.52 (tCYC= 0.735μs)		97.92 (tCYC= 3.06μs)	
			AD conversion time=64×tCYC (when ADCR2=1) (Note 6-2)	4.5 to 5.5	18.82 (tCYC= 0.294μs)		97.92 (tCYC= 1.53μs)	
				3.0 to 5.5	47.04 (tCYC= 0.735μs)		97.92 (tCYC= 1.53μs)	
Analog input voltage range	VAIN			3.0 to 5.5	VSS		VDD	V
Analog port input current	IAINH		VAIN=VDD	3.0 to 5.5			1	μA
	IAINL		VAIN=VSS	3.0 to 5.5	-1			

Note 6-1: The quantization error ($\pm 1/2\text{LSB}$) is excluded from the absolute accuracy.

Note 6-2: The conversion time refers to the period from the time when an instruction for starting a conversion process is issued to the time the conversion results register(s) are loaded with a complete digital conversion value corresponding to the analog input value.

Main System Clock Oscillation

The constant values of the oscillator and oscillation circuit for the main and system clocks must be determined after exercising extensive oscillation evaluation tests. For an application in which the USB host function is to be used, use an oscillator having the accuracy and precision that satisfy the USB specifications.

The oscillation stabilization time refers to the time interval that is required for the oscillation to get stabilized in the following cases (see Figure 4):

- Till the oscillation gets stabilized after V_{DD} goes above the operating voltage lower limit.
- Till the oscillation gets stabilized after the instruction for starting the main clock oscillation circuit is executed.
- Till the oscillation gets stabilized after the HOLD mode is released.
- Till the oscillation gets stabilized after the X'tal HOLD mode is released with CFSTOP (OCR register, bit 0) set to 0.

Subsystem Clock Oscillation

Table 1 shows the characteristics of a sample subsystem clock oscillation circuit that are measured using a SANYO-designated oscillation characteristics evaluation board and external components with circuit constant values with which the oscillator vendor confirmed normal and stable oscillation.

Table 1 Characteristics of a Sample subsystem Clock Oscillator Circuit with a Crystal Oscillator

Nominal Frequency	Vendor Name	Oscillator Name	Circuit Constant				Operating Voltage Range [V]	Oscillation Stabilization Time		Remarks
			C3 [pF]	C4 [pF]	Rf [Ω]	Rd2 [Ω]		typ [s]	max [s]	
32.768kHz	EPSON TOYOCOM	MC-306	18	18	OPEN	560k	2.7 to 5.0	1.1	3.0	Applicable CL value=12.5pF SMD type

The oscillation stabilization time refers to the time interval that is required for the oscillation to get stabilized in the following cases (see Figure 4):

- Till the oscillation gets stabilized after the instruction for starting the subclock oscillation circuit is executed.
- Till the oscillation gets stabilized after the HOLD mode is released with EXTOSC (OCR register, bit 6) set to 1.

Note: The components that are involved in oscillation should be placed as close to the IC and to one another as possible because they are vulnerable to the influences of the circuit pattern.

Figure 4 Oscillation Stabilization Time

When using the internal PLL circuit to generate the 48MHz clock for USB, it is necessary to connect a filter circuit to the P34/UFILT pin such as that shown in the left figure.

Figure 5 External Filter Circuit for the Internal USB-dedicated PLL Circuit

To generate the master clock for the audio interface using the internal PLL circuit, it is necessary to connect a filter circuit to the P33/AFILT pin that is shown in the left figure.

Figure 6 External Filter Circuit for Audio Interface (Used with Internal PLL Circuit)

It is necessary to adjust the Circuit Constant of the USB Port Peripheral Circuit for each mounting board.

Figure 7 USB Port Peripheral Circuit

LC87F1JJ2A

Note:
Determine the value of C_{RES} and R_{RES} so that the reset signal is present for a period of $200\mu s$ after the supply voltage goes beyond the lower limit of the IC's operating voltage.

- SANYO Semiconductor Co.,Ltd. assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein.
- Regarding monolithic semiconductors, if you should intend to use this IC continuously under high temperature, high current, high voltage, or drastic temperature change, even if it is used within the range of absolute maximum ratings or operating conditions, there is a possibility of decrease reliability. Please contact us for a confirmation.
- SANYO Semiconductor Co.,Ltd. strives to supply high-quality high-reliability products, however, any and all semiconductor products fail or malfunction with some probability. It is possible that these probabilistic failures or malfunction could give rise to accidents or events that could endanger human lives, trouble that could give rise to smoke or fire, or accidents that could cause damage to other property. When designing equipment, adopt safety measures so that these kinds of accidents or events cannot occur. Such measures include but are not limited to protective circuits and error prevention circuits for safe design, redundant design, and structural design.
- In the event that any or all SANYO Semiconductor Co.,Ltd. products described or contained herein are controlled under any of applicable local export control laws and regulations, such products may require the export license from the authorities concerned in accordance with the above law.
