## Dual 5 A High Speed Low-Side MOSFET Drivers with Enable

NCV81071 is a high speed dual low-side MOSFETs driver. It is capable of providing large peak currents into capacitive loads. This driver can deliver 5 A peak current at the Miller plateau region to help reduce the Miller effect during MOSFETs switching transition. This driver also provides enable functions to give users better control capability in different applications. ENA and ENB are implemented on pin 1 and pin 8 which were previously unused in the industry standard pin-out. They are internally pulled up to driver's input voltage for active high logic and can be left open for standard operations.

### Features

- High Current Drive Capability  $\pm 5$  A
- TTL/CMOS Compatible Inputs Independent of Supply Voltage
- Industry Standard Pin-out
- Enable Functions for Each Driver
- 8 ns Typical Rise and 8 ns Typical Fall Times with 1.8 nF Load
- Typical Propagation Delay Times of 20 ns with Input Falling and 20 ns with Input Rising
- Input Voltage from 4.5 V to 20 V
- Dual Outputs can be Paralleled for Higher Drive Current
- Fully Specified from  $-40^{\circ}\text{C}$  to  $+140^{\circ}\text{C}$
- AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

### Applications

- Server Power
- Telecommunication, Datacenter Power
- Synchronous Rectifier
- Switch Mode Power Supply
- DC/DC Converter
- Power Factor Correction
- Motor Drive
- Renewable Energy, Solar Inverter

# NCV81071

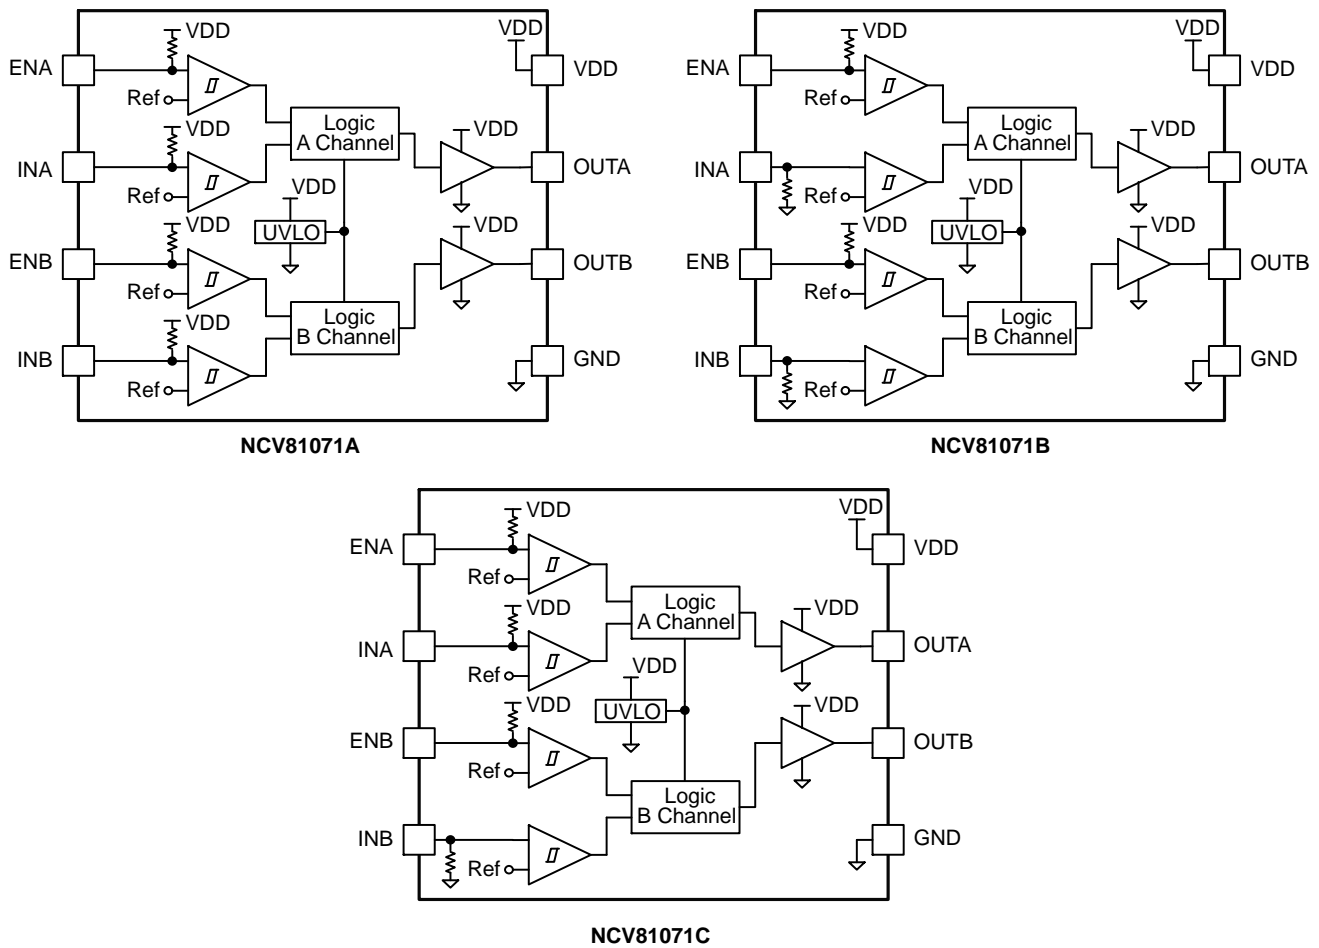

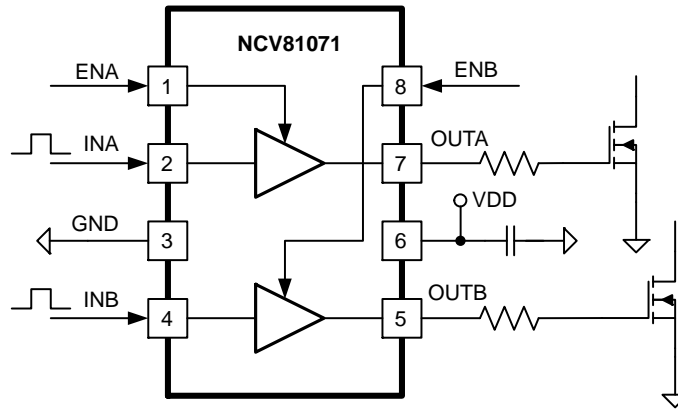

Figure 1. NCV81071 Block Diagram

Table 1. PIN DESCRIPTION

Pin No.	Symbol	Description
1	ENA	Enable input for the driver channel A with logic compatible threshold and hysteresis. This pin is used to enable and disable the driver output. It is internally pulled up to VDD with a 200 kΩ resistor for active high operation. The output of the pin when the device is disabled will be always low.
2	INA	Input of driver channel A which has logic compatible threshold and hysteresis. If not used, this pin should be connected to either VDD or GND. It should not be left unconnected.
3	GND	Common ground. This ground should be connected very closely to the source of the power MOSFET.
4	INB	Input of driver channel B which has logic compatible threshold and hysteresis. If not used, this pin should be connected to either VDD or GND. It should not be left unconnected.
5	OUTB	Output of driver channel B. The driver is able to provide 5 A drive current to the gate of the power MOSFET.
6	VDD	Supply voltage. Use this pin to connect the input power for the driver device.
7	OUTA	Output of driver channel A. The driver is able to provide 5 A drive current to the gate of the power MOSFET.
8	ENB	Enable input for the driver channel B with logic compatible threshold and hysteresis. This pin is used to enable and disable the driver output. It is internally pulled up to VDD with a 200 kΩ resistor for active high operation. The output of the pin when the device is disabled will be always low.

## TYPICAL APPLICATION CIRCUIT

**Table 2. ABSOLUTE MAXIMUM RATINGS**

		Value		Unit
		Min	Max	
Supply Voltage	VDD	-0.3	24	V
Output Current (DC)	I <sub>out_dc</sub>	0.3		A
Output Current (Pulse < 0.5 μs)	I <sub>out_pulse</sub>	6.0		A
Input Voltage	INA, INB	-6.0	VDD+0.3	V
Enable Voltage	ENA, ENB	-0.3	VDD+0.3	
Output Voltage	OUTA, OUTB	-0.3	VDD+0.3	V
Junction Operation Temperature	T <sub>J</sub>	-40	150	°C
Storage Temperature	T <sub>stg</sub>	-65	160	
Electrostatic Discharge	Human body model, HBM	5500		V
	Charge device model, CDM	2500		
OUTA OUTB Latch-up Protection		500		mA

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

**Table 3. RECOMMENDED OPERATING CONDITIONS**

Parameter	Rating	Unit
VDD supply Voltage	4.5 to 20	V
INA, INB input voltage	-5.0 to VDD	V
ENA, ENB input voltage	0 to VDD	V
Junction Temperature Range	-40 to +140	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

## LAYOUT GUIDELINES

The switching performance of NCV81071 highly depends on the design of PCB board. The following layout design guidelines are recommended when designing boards using these high speed drivers.

Place the driver as close as possible to the driven MOSFET.

Place the bypass capacitor between VDD and GND as close as possible to the driver to improve the noise filtering. It is preferred to use low inductance components such as chip capacitor and chip resistor. If vias are used, connect several paralleled vias to reduce the inductance of the vias.

Minimize the turn-on/sourcing current and turn-off/sinking current paths in order to minimize stray inductance. Otherwise high di/dt established in these loops with stray inductance can induce significant voltage spikes on the output of the driver and MOSFET Gate terminal.

Keep power loops as short as possible by paralleling the source and return traces (flux cancellation).

Keep low level signal lines away from high level power lines with a lot of switching noise.

Place a ground plane for better noise shielding. Beside noise shielding, ground plane is also useful for heat dissipation.

NCV81071 MSOP package has a thermal pad for: 1) quiet GND for all the driver circuits; 2) heat sink for the driver. This pad must be connected to a ground plane and no switching currents from the driven MOSFET should pass through the ground plane under the driver. To maximize the heatsinking capability, it is recommended several ground layers are added to connect to the ground plane and thermal pad. A via array within the area of package can conduct the heat from the package to the ground layers and the whole PCB board. The number of vias and the size of ground plane are determined by the power dissipation of NCV81071 (VDD voltage, switching frequency and load condition), the air flow condition and its maximum junction temperature.
