

# 具有电源路径管理功能的 **2.5A**，双输入，单节开关模式锂离子电池充电器

 查询样片: [bq24165](#), [bq24166](#), [bq24167](#)

## 特性

- 具有独立电源路径控制的高效开关模式充电器
  - 使用深度放电电池或者在无电池的情况下进行 **GSM** 呼叫
  - 从深度放电电池或者在无电池的情况下快速启动系统
- 双输入充电器
  - 额定输入电压 **20V**，并具有过压保护功能 (**OVP**)
    - **USB** 输入电压 **6.5V**
    - **IN** 输入电压 **10.5V**
  - 集成场效应晶体管 (**FET**) 可使充电率高达 **2.5A**
    - **IN** 输入高达 **2.5A**
    - **USB** 输入高达 **1.5A**
- 用于电源路径管理的高度集成电池 **N** 通道金属氧化物半导体场效应晶体管 (**MOSFET**) 控制器
- 安全且精确的电池管理功能
  - 电池调节精度 **0.5%**
  - **10%** 充电电流准确度
- 可调充电电流，输入电流限制，和 **VINDPM** 阈值（用于 **IN** 输入）
- **JEITA** 实现简便
  - 充电参数选择器输入 (**CE1**, **CE2**) 用于 (**bq24165**)
- 基于电压的，**NTC** 监控输入 (**TS**)
  - 标准温度范围 (**bq24166**)
  - **JEITA** 兼容 (**bq24167**)
- 针对输出电流控制的热调节保护
- 低电池泄漏电流，**BAT** 短路保护
- 软启动特性降低涌入电流
- 热关断和保护
- 采用小型 **2.8mm × 2.8mm 49** 焊球晶圆级芯片封装 (**WCSP**) 或 **4mm × 4mm** 四方扁平无引线 (**QFN**) 封装

## 应用范围

- 手持产品
- 便携式媒体播放器
- 便携式设备
- 上网本和便携式互联网器件

## 说明

bq24165, bq24166 和 bq24167 是高度集成的单节锂离子电池充电器和系统电源路径管理器件，这些器件主要是针对空间有限且含有大容量电池的便携式应用。此单节充电器具有双输入，此双输入使得器件能够在 **USB** 端口或者更高功率输入电源的情况下（即交流适配器或者无线充电输入）用于多用解决方案。这两个输入相互之间完全独立并且由 bq24165/166/167 使用具有优先级的 **IN** 输入进行管理。

## 应用电路原理图

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

这些装置包含有限的内置 ESD 保护。存储或装卸时，应将导线一起截短或将装置放置于导电泡棉中，以防止 MOS 门极遭受静电损伤。

## 说明（继续）

此电源路径管理特性使得 bq24165/166/167 能够从高效直流到直流转换器为系统供电而与此同时对电池进行独立充电。此充电器一直监视电池电流并在系统负载所需电流在输入电流限制之上时减少充电电流。这样可实现正常的充电终止和定时器运行。系统电压被调节至电池电压，但不会下降至低于 3.5V。最小系统电压支持使得此系统能够与一个残次品或者有缺失的电池组一起运行并且即使在电池完全放电或者无电池的情况下也可实现瞬时系统启动。当适配器不能传送峰值系统电流时，此电源路径管理架构还允许电池补充系统电流需要。这样可使用较小的适配器。此 2.5A 输入电流性能可以在不考虑电池电压的情况下一旦适配器被插入即可进行 GSM 电话呼叫。

电池充电经历以下三个阶段：调节，恒定电流和恒定电压。在所有的充电阶段，一个内部控制环路监视 IC 结温并且如果超过此内部温度阈值则减少充电电流。此外，bq24166 和 bq24167 提供基于电压的电池组热敏电阻监控输入 (TS) 来监控电池温度以保证安全充电。Bq24166 的 TS 功能与 JEITA 兼容。

## ORDERING INFORMATION

PART NUMBER	USB OVP	IN OVP	NTC MONITORING (TS)	JEITA COMPATIBLE	Package
bq24165YFFR	6.5V	10.5 V	No	Yes	WCSP
bq24165YFFT	6.5 V	10.5 V	No	Yes	WCSP
bq24165RGER	6.5V	10.5 V	No	Yes	QFN
bq24165RGET	6.5 V	10.5 V	No	Yes	QFN
bq24166YFFR	6.5 V	10.5 V	Yes	No	WCSP

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

over operating free-air temperature range (unless otherwise noted)

		VALUE/UNITS
Pin voltage range (with respect to PGND)	IN, USB	–2 V to 20 V
	PMIDI, PMIDU, BOOT	–0.3 V to 20 V
	SW	–0.7 V to 12V
	ISET, ILIM, SCL, SYS, BAT, BGATE, DRV, $\overline{\text{PG}}$ , $\overline{\text{CHG}}$ , VDPM, IUSB_, $\overline{\text{CE}}$ _, TS	–0.3 V to 7 V
BOOT to SW		–0.3 V to 7 V
Output current (Continuous)	SW	4.5 A
	SYS, BAT	3.5 A
Input current (Continuous)	IN	2.75 A
	USB	1.75 A
Output sink current	$\overline{\text{PG}}$ , $\overline{\text{CHG}}$	10 mA
Operating free-air temperature range		–40°C to 85°C
Junction temperature, T <sub>J</sub>		–40°C to 125°C
Storage temperature, T <sub>STG</sub>		–65°C to 150°C
Lead temperature (soldering, 10 s)		300°C

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. All voltage values are with respect to the network ground terminal unless otherwise noted.

## THERMAL INFORMATION

THERMAL METRIC <sup>(1)</sup>	bq2416x		UNITS
	49 PINS (YFF)	24 PINS (RGE)	
$\theta_{JA}$ Junction-to-ambient thermal resistance	49.8	32.6	°C/W
$\theta_{JCTop}$ Junction-to-case (top) thermal resistance	0.2	30.5	
$\theta_{JB}$ Junction-to-board thermal resistance	1.1	3.3	
$\psi_{JT}$ Junction-to-top characterization parameter	1.1	0.4	
$\psi_{JB}$ Junction-to-board characterization parameter	6.6	9.3	
$\theta_{JCbott}$ Junction-to-case (bottom) thermal resistance	n/a	2.6	

- (1) 有关传统和新的热 度量的更多信息，请参阅 *IC 封装热量应用报告*，SPRA953。

## RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNITS
V <sub>IN</sub>	IN voltage range	4.2	18 <sup>(1)</sup>	V
	IN operating voltage range	4.2	10	
V <sub>USB</sub>	USB voltage range	4.2	18 <sup>(1)</sup>	V
	USB operating range	4.2	6	
I <sub>IN</sub>	Input current, IN input		2.5	A
I <sub>USB</sub>	Input current USB input		1.5	A
I <sub>SYS</sub>	Output current from SW, DC		3	A
I <sub>BAT</sub>	Charging		2.5	A
	Discharging, using internal battery FET		2.5	A
T <sub>J</sub>	Operating junction temperature range	0	125	°C

- (1) The inherent switching noise voltage spikes should not exceed the absolute maximum rating on either the BOOT or SW pins. A tight layout minimizes switching noise.

## ELECTRICAL CHARACTERISTICS

Circuit of Figure 1,  $V_{SUPPLY} = V_{USB}$  or  $V_{IN}$  (whichever is supplying the IC),  $V_{UVLO} < V_{SUPPLY} < V_{OVP}$  and  $V_{SUPPLY} > V_{BAT} + V_{SLP}$ ,  
 $T_J = 0^\circ\text{C} - 125^\circ\text{C}$  and  $T_J = 25^\circ\text{C}$  for typical values (unless otherwise noted)

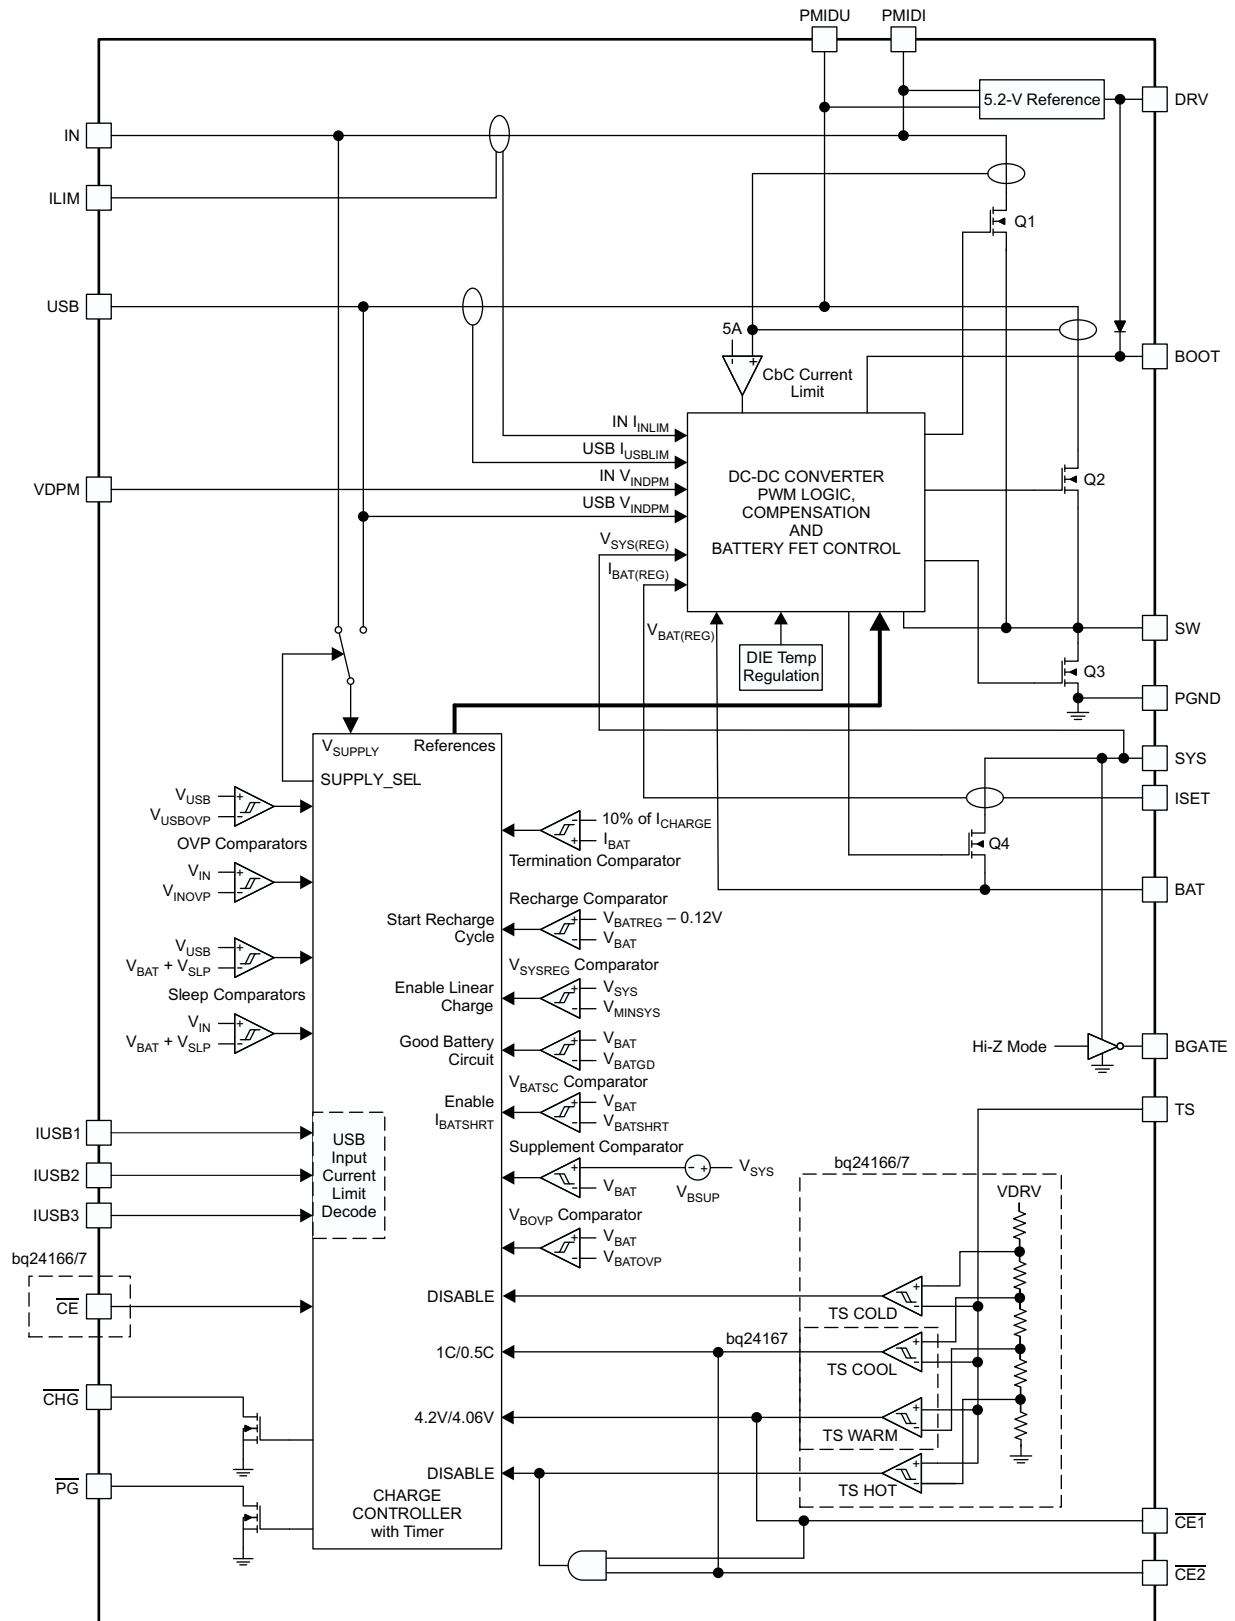

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNITS		
$I_{SUPPLY}$	Supply current for control ( $V_{IN}$ or $V_{USB}$ )	$V_{UVLO} < V_{SUPPLY} < V_{OVP}$ and $V_{SUPPLY} > V_{BAT} + V_{SLP}$ , PWM switching	15		mA		
		$V_{UVLO} < V_{SUPPLY} < V_{OVP}$ and $V_{SUPPLY} > V_{BAT} + V_{SLP}$ , PWM NOT switching		5			
		$0^\circ\text{C} < T_J < 85^\circ\text{C}$ , High-Z Mode			175	$\mu\text{A}$	
$I_{BATLEAK}$	Leakage current from BAT to the Supply	$0^\circ\text{C} < T_J < 85^\circ\text{C}$ , $V_{BAT} = 4.2\text{ V}$ , $V_{USB} = V_{IN} = 0\text{ V}$		5	$\mu\text{A}$		
$I_{BAT\_HIZ}$	Battery discharge current in high impedance mode, (BAT, SW, SYS)	$0^\circ\text{C} < T_J < 85^\circ\text{C}$ , $V_{BAT} = 4.2\text{ V}$ , $V_{SUPPLY} = 0\text{ V}$ or $5\text{ V}$ $I_{USB1}=I_{USB2}=I_{USB3}=1$ , High-Z mode		55	$\mu\text{A}$		
<b>POWER PATH MANAGEMENT</b>							
$V_{SYS(REG)}$	System regulation voltage	$V_{BAT} < V_{MINSYS}$	3.6	3.7	3.82	V	
$V_{SYSREGFETOFF}$		Battery FET turned off, Charge disable or termination	4.26	4.33	4.37		
$V_{MINSYS}$	Minimum system regulation voltage	$V_{BAT} < V_{MINSYS}$ , Input current limit or $V_{INDPM}$ active	3.4	3.5	3.62	V	
$V_{BSUP1}$	Enter supplement mode threshold	$V_{BAT} > 2.5\text{ V}$		$V_{BAT} - 40\text{mV}$		V	
$V_{BSUP2}$	Exit supplement mode threshold	$V_{BAT} > 2.5\text{ V}$		$V_{BAT} - 10\text{mV}$		V	
$I_{LIM(Discharge)}$	Current limit, discharge or supplement mode	Current monitored in internal FET only.		7		A	
$t_{DGL(SC1)}$	Deglitch time, OUT short circuit during discharge or supplement mode	Measured from ( $V_{BAT} - V_{SYS}$ ) = 300mV to $V_{BGATE} = (V_{BAT} - 600\text{mV})$		250		$\mu\text{s}$	
$t_{REC(SC1)}$	Recovery time, OUT short circuit during discharge or supplement mode			60		ms	
	Battery range for BGATE operation		2.5		4.5	V	
<b>BATTERY CHARGER</b>							
$R_{ON(BAT-SYS)}$	Internal battery charger MOSFET on-resistance	Measured from BAT to SYS, $V_{BAT} = 4.2\text{ V}$	YFF pkg	37	57	m $\Omega$	
			RGE pkg	50	70		
$V_{BATREG}$	Battery regulation voltage	$T_A = 25^\circ\text{C}$ , $\overline{CE1} = \overline{CE2} = 0$	4.179	4.2	4.221	V	
		$\overline{CE1} = \overline{CE2} = 0$ or $V_{WARM} < V_{TS} < V_{COOL}$	4.160	4.2	4.24		
		$T_A = 25^\circ\text{C}$ , $\overline{CE1} = 1$ , $\overline{CE2} = 0$	4.04	4.06	4.08		
		$\overline{CE1} = 1$ , $\overline{CE2} = 0$ or $V_{HOT} < V_{TS} < V_{WARM}$	4.02	4.06	4.1		
$I_{CHARGE}$	Charge current programmable range	$I_{CHARGE} = \frac{K_{SET}}{R_{SET}}$	550		2500	mA	
$K_{SET}$	Programmable fast charge current factor	$T_A = 0^\circ\text{C}$ to $125^\circ\text{C}$ , $\overline{CE1} = \overline{CE2} = 0$ or $V_{WARM} < V_{TS} < V_{COOL}$	450	490	540	A $\Omega$	
		$T_A = 0^\circ\text{C}$ to $125^\circ\text{C}$ , $\overline{CE1} = 1$ , $\overline{CE2} = 0$ or $V_{COLD} < V_{TS} < V_{COOL}$	225	245	270		
$V_{BATSHRT}$	Battery short threshold	$V_{BAT}$ Rising	2.9	3.0	3.1	V	
$V_{BATSHRTHYS}$	Battery short threshold hysteresis	$V_{BAT}$ Falling		100		mV	
$I_{BATSHRT}$	Battery short current	$V_{BAT} < V_{BATSHRT}$		50.0		mA	
$t_{DGL(BATSHRT)}$	Deglitch time for battery short to fastcharge transition		32			ms	
$I_{TERM}$	Termination charge current	$I_{CHARGE} \leq 1\text{ A}$	7	10	11.5	% $I_{CHARGE}$	
		$I_{CHARGE} > 1\text{ A}$	8	10	11		
$t_{DGL(TERM)}$	Deglitch time for charge termination	Both rising and falling, 2-mV over-drive, $t_{RISE}, t_{FALL} = 100\text{ ns}$		32		ms	
$V_{RCH}$	Recharge threshold voltage	Below $V_{BATREG}$		120		mV	
$t_{DGL(RCH)}$	Deglitch time	$V_{BAT}$ falling below $V_{RCH}$ , $t_{FALL} = 100\text{ns}$		32		ms	
$I_{DETECT}$	Battery detection current before charge done (sink current)			2.5		mA	
$t_{DETECT}$	Battery detection time			250		ms	
<b>INPUT PROTECTION</b>							
$I_{IN\_USB}$	Input current limiting threshold (USB input only)	USB charge mode, $V_{USB} = 5\text{ V}$ , Current pulled from PMIDU	$I_{INUSB} = \text{USB100}$	90	95	100	mA
			$I_{INUSB} = \text{USB500}$	450	475	500	
			$I_{INUSB} = \text{USB150}$	135	142.5	150	
			$I_{INUSB} = \text{USB900}$	800	850	900	
			$I_{INUSB} = \text{USB800}$	700	750	800	
			$I_{INUSB} = 1.5\text{ A}$	1250	1400	1500	

## ELECTRICAL CHARACTERISTICS (continued)

Circuit of Figure 1,  $V_{SUPPLY} = V_{USB}$  or  $V_{IN}$  (whichever is supplying the IC),  $V_{UVLO} < V_{SUPPLY} < V_{OVP}$  and  $V_{SUPPLY} > V_{BAT} + V_{SLP}$ ,  
 $T_J = 0^\circ\text{C} - 125^\circ\text{C}$  and  $T_J = 25^\circ\text{C}$  for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNITS
$I_{INLIM}$	Maximum input current limit programmable range for IN input	$I_{INLIM} = \frac{K_{ILIM}}{R_{ILIM}}$	1000		2500	mA
$K_{ILIM}$	Maximum input current factor for IN input		238	251	264	AΩ
$V_{IN\_DPM\_IN}$	$V_{IN\_DPM}$ threshold programmable range for IN Input		4.2		10	V
	VDPM threshold		1.18	1.2	1.22	V
$V_{IN\_DPM\_USB}$	$V_{IN\_DPM}$ threshold for USB Input	USB100, USB150	4.175	4.28	4.36	V
		USB500, USB800, USB900, 1.5A current limit selected	4.35	4.44	4.52	V
$V_{DRV}$	Internal bias regulator voltage	$V_{SUPPLY} > 5.45\text{V}$	5	5.2	5.45	V
$I_{DRV}$	DRV Output current		10			mA
$V_{DO\_DRV}$	DRV Dropout voltage ( $V_{SUPPLY} - V_{DRV}$ )	$I_{SUPPLY} = 1\text{A}$ , $V_{SUPPLY} = 5\text{V}$ , $I_{DRV} = 10\text{mA}$			450	mV
$V_{UVLO}$	Under-voltage lockout threshold voltage	$V_{IN}$ or $V_{USB}$ rising, 150mV Hysteresis	3.6	3.8	4.0	V
$V_{SLP}$	Sleep-mode entry threshold, $V_{SUPPLY} - V_{BAT}$	$2.0\text{V} \leq V_{BAT} \leq V_{OREG}$ , $V_{IN}$ falling	0	40	100	mV
$V_{SLP\_EXIT}$	Sleep-mode exit hysteresis	$2.0\text{V} \leq V_{BAT} \leq V_{OREG}$	40	100	175	mV
	Deglitch time for supply rising above $V_{SLP} + V_{SLP\_EXIT}$	Rising voltage, 2-mV over drive, $t_{RISE} = 100\text{ns}$		30		ms
$V_{OVP}$	Input supply OVP threshold voltage	USB, $V_{USB}$ Rising IN, $V_{IN}$ Rising	6.3 10.3	6.5 10.5	6.7 10.7	V
$V_{OVP(HYS)}$	$V_{OVP}$ hysteresis	Supply falling from $V_{OVP}$		100		mV
$V_{BOVP}$	Battery OVP threshold voltage	$V_{BAT}$ threshold over $V_{OREG}$ to turn off charger during charge	$1.025 \times V_{BATREG}$	$1.05 \times V_{BATREG}$	$1.075 \times V_{BATREG}$	V
$V_{BATUVLO}$	Battery UVLO threshold voltage			2.5		V
$I_{LIMIT}$	Cycle by Cycle current limit		4.1	4.9	5.6	A
$T_{SHUTDWN}$	Thermal shutdown	10C Hysteresis		165		C
$T_{REG}$	Thermal regulation threshold			120		C
	Safety Timer		324	360	396	min
<b>IUSB_, CE_, PG, CHG</b>						
$V_{IH}$	Input high threshold		1.3			V
$V_{IL}$	Input low threshold				0.4	V
$I_{IH}$	High-level leakage current	$V_{CHG} = V_{PG} = 5\text{V}$			1	μA
$V_{OL}$	Low-level output saturation voltage	$I_O = 10\text{mA}$ , sink current			0.4	V
<b>PWM CONVERTER</b>						
	Internal top reverse blocking MOSFET on-resistance	$I_{N\_LIMIT} = 500\text{mA}$ , Measured from $V_{USB}$ to PMIDU $I_{N\_LIMIT} = 500\text{mA}$ , Measured from $V_{IN}$ to PMIDI	95 45		175 80	mΩ
	Internal top N-channel Switching MOSFET on-resistance	Measured from PMIDU to SW Measured from PMIDI to SW	100 65		175 110	mΩ
	Internal bottom N-channel MOSFET on-resistance	Measured from SW to PGND	65		115	mΩ
$f_{OSC}$	Oscillator frequency		1.35	1.50	1.65	MHz
$D_{MAX}$	Maximum duty cycle			95%		
$D_{MIN}$	Minimum duty cycle		0			
<b>BATTERY-PACK NTC MONITOR (bq24166, bq24167)</b>						
$V_{HOT}$	High temperature threshold	$V_{TS}$ falling	29.7	30	30.5	% $V_{DRV}$
$V_{HYS(HOT)}$	Hysteresis on high threshold	$V_{TS}$ rising		1		
$V_{WARM}$	Warm temperature threshold	$V_{TS}$ falling, bq24167 only	37.9	38.3	39.6	% $V_{DRV}$
$V_{HYS(WARM)}$	Hysteresis on high threshold	$V_{TS}$ rising, bq24167 only		1		
$V_{COOL}$	Cool temperature threshold	$V_{TS}$ rising, bq24167 only	56.0	56.5	56.9	% $V_{DRV}$
$V_{HYS(COOL)}$	Hysteresis on low threshold	$V_{TS}$ falling, bq24167 only		1		
$V_{COLD}$	Low temperature threshold	$V_{TS}$ rising	59.5	60	60.4	% $V_{DRV}$
$V_{HYS(COLD)}$	Hysteresis on low threshold	$V_{TS}$ falling		1		
$T_{SOFF}$	TS Disable threshold	$V_{TS}$ rising, 2% $V_{DRV}$ Hysteresis	70		73	% $V_{DRV}$
$t_{DGL(TS)}$	Deglitch time on TS change			50		ms

**PIN FUNCTIONS**

PIN NAME	PIN NUMBER				I/O	DESCRIPTION
	bq24165		bq24166/7			
	YFF	RGE	YFF	RGE		
IN	A1–A4	21	A1–A4	21	I	Input power supply. IN is connected to the external DC supply (AC adapter or alternate power source). Bypass IN to PGND with at least a 1µF ceramic capacitor.
USB	A5–A7	22	A5–A7	22	I	USB Input Power Supply. USB is connected to the external DC supply (AC adapter or USB port). Bypass USB to PGND with at least a 1µF ceramic capacitor.
PMIDI	B1–B4	20	B1–B4	20	O	Reverse Blocking MOSFET and High Side MOSFET Connection Point for High Power Input. Bypass PMIDI to GND with at least a 4.7µF ceramic capacitor. Use caution when connecting an external load to PMIDI. The PMIDI output is not current limited. Any short on PMIDI will result in damage to the IC.
PMIDU	B5–B7	23	B5–B7	23	O	Reverse Blocking MOSFET and High Side MOSFET Connection Point for USB Input. Bypass PMIDU to GND with at least a 4.7µF ceramic capacitor. Use caution when connecting an external load to PMIDU. The PMIDU output is not current limited. Any short on PMIDU will result in damage to the IC.
SW	C1–C7	18	C1–C7	18	O	Inductor Connection. Connect to the switched side of the external inductor.
PGND	D1–D7	16, 17	D1–D7	16, 17	–	Ground terminal. Connect to the thermal pad (for QFN only) and the ground plane of the circuit.
ILIM	E1	15	E1	15	I	IN Input Current Limit Programming Input. Connect a resistor from ILIM to GND to program the input current limit for IN. The current limit is programmable from 1A to 2.5A. ILIM has no effect on the USB input.
VDPM	E3	1	E3	1	I	Input DPM Programming Input. Connect a resistor divider from IN to GND with VDPM connected to the center tap to program the Input Voltage based Dynamic Power Management (V <sub>IN</sub> -DPM) threshold. The input current is reduced to maintain the supply voltage at V <sub>IN</sub> -DPM. See the <i>Input Voltage based Dynamic Power Management</i> section for a detailed explanation.
$\overline{CE}$	–	–	E4	24	I	Charge Enable Input. $\overline{CE}$ is used to disable or enable the charge process. A low logic level (0) enables charging and a high logic level (1) disables charging. When charging is disabled, the SYS output remains in regulation, but BAT is disconnected from SYS. Supplement mode is still available if the system load demands cannot be met by the supply. BGATE is high impedance when $\overline{CE}$ is high.
IUSB1	E5	4	E5	4	I	USB Input Current Limit Programming Inputs. USB1, USB2 and USB3 program the input current limit for the USB input. USB2.0 and USB3.0 current limits are available for easy implementation of these standards. <a href="#">Table 1</a> shows the settings for these inputs. USB1, USB2 and USB3 have no effect on the IN input.
IUSB2	E6	3	E6	3	I	
IUSB3	E2	2	E2	2	I	
$\overline{CE1}$	E4	24	–	–	I	JEITA Compliance Inputs. $\overline{CE1}$ and $\overline{CE2}$ are used to change battery regulation and charge current regulation to comply with the JEITA charging standard. The charge voltage can be reduced by 140mV or the charge current may be reduced to half the programmed value. See <a href="#">Table 2</a> for programming details.
$\overline{CE2}$	G5	9	–	–	I	
BOOT	E7	19	E7	19	I	High Side MOSFET Gate Driver Supply. Connect a 0.01µF ceramic capacitor (voltage rating > 10V) from BOOT to SW to supply the gate drive for the high side MOSFETs.
SYS	F1–F4	13, 14	F1–F4	13, 14	I	System Voltage Sense and Charger FET Connection. Connect SYS to the system output at the output bulk capacitors. Bypass SYS locally with at least 10µF. 47µF bypass capacitance is recommended for best transient response.
BGATE	F5	10	F5	10	O	External Discharge MOSFET Gate Connection. BGATE drives an external P-Channel MOSFET to provide a very low resistance discharge path. Connect BGATE to the gate of the external MOSFET. BGATE is low during high impedance mode and when no input is connected. BGATE is optional. If unused, leave BGATE unconnected.
$\overline{PG}$	F6	7	F6	7	O	Power Good Open Drain Output. $\overline{PG}$ is pulled low when a valid supply is connected to either USB or IN. A valid supply is between V <sub>BAT</sub> +V <sub>SLP</sub> and V <sub>OVP</sub> . If not supply is connected or the supply is out of this range, $\overline{PG}$ is high impedance.

**PIN FUNCTIONS (continued)**

PIN NAME	PIN NUMBER				I/O	DESCRIPTION
	bq24165		bq24166/7			
	YFF	RGE	YFF	RGE		
DRV	F7	6	F7	6	O	Gate Drive Supply. DRV is the bias supply for the gate drive of the internal MOSFETs. bypass DRV to PGND with a 1µF ceramic capacitor. DRV may be used to drive external loads up to 10mA. DRV is active whenever the input is connected and $V_{SUPPLY} > V_{UVLO}$ and $V_{SUPPLY} > (V_{BAT} + V_{SLP})$
BAT	G1–G4	11, 12	G1–G4	11, 12	I/O	Battery Connection. Connect to the positive terminal of the battery. Additionally, bypass BAT to GND with at least a 1µF capacitor.
TS	–	–	G5	9	I	Battery Pack NTC Monitor. Connect TS to the center tap of a resistor divider from DRV to GND. The NTC is connected from TS to GND. The TS function in the bq24166 provides 2 thresholds for Hot/ Cold shutoff, while the bq24167 has 2 additional thresholds for JEITA compliance. See the <i>NTC Monitor</i> section for more details on operation and selecting the resistor values. Connect TS to DRV to disable the TS function.
$\overline{\text{CHG}}$	G6	8	G6	8	O	Charge Status Open Drain Output. $\overline{\text{CHG}}$ is pulled low when a charge cycle starts and remains low while charging. $\overline{\text{CHG}}$ is high impedance when the charging terminates and when no supply exists. CHG does not indicate recharge cycles.

## DETAILED DESCRIPTION

### CHARGE MODE OPERATION

#### Charge Profile

Charging is done through the internal battery MOSFET. When the battery voltage is above 3.5V, the system output (SYS) is connected to the battery to maximize the charging efficiency. There are 6 loops that influence the charge current; constant current loop (CC), constant voltage loop (CV), input current loop, thermal regulation loop, minimum system voltage loop (MINSYS) and input voltage dynamic power management loop ( $V_{INDPM}$ ). During the charging process, all six loops are enabled and the dominate one takes control. The bq24165/6/7 supports a precision Li-Ion or Li-Polymer charging system for single-cell applications. The minimum system output feature regulates the system voltage to a minimum of  $V_{SYS(REG)}$ , so that startup is enabled even for a missing or deeply discharged battery. Figure 20 shows a typical charge profile including the minimum system output voltage feature.

Figure 20. Typical Charging Profile of bq24165/6/7

### PWM CONTROLLER IN CHARGE MODE

The bq24165/6/7 provides an integrated, fixed 1.5 MHz frequency voltage-mode converter to power the system and supply the charge current. The voltage loop is internally compensated and provides enough phase margin for stable operation, allowing the use of small ceramic capacitors with very low ESR.

The bq24165/6/7 input scheme prevents battery discharge when the supply voltages is lower than  $V_{BAT}$  and also isolates the two inputs from each other. The high-side N-MOSFET (Q1/Q2) switches to control the power delivered to the output. The DRV LDO supplies the gate drive for the internal MOSFETs. The high side FETs are supplied through a boot strap circuit with external boot-strap capacitor is used to boost up the gate drive voltage for Q1/Q2.

Both inputs are protected by a cycle-by-cycle current limit that is sensed through the internal MOSFETs for Q1 and Q2. The threshold for the current limit is set to a nominal 5-A peak current. The inputs also utilize an input current limit that limits the current from the power source.

## BATTERY CHARGING PROCESS

Assuming a valid input source has already been attached to IN or USB, as soon as a deeply discharged or shorted battery is attached to the BAT pin, the bq24165/6/7 applies a 50mA current to bring the battery voltage up to acceptable charging levels. During this pre-charge time, the battery FET is linearly regulated to maintain the system output regulation at  $V_{SYS(REG)}$ . Once the battery rises above  $V_{BATSHRT}$ , the charge current increases to the fastcharge current setting. The SYS voltage is regulated to  $V_{SYS(REG)}$  while the battery is linearly charged through the battery FET. Under normal conditions, the time spent in this region is a very short percentage of the total charging time, so if the charge current is reduced, the reduced charge rate does not have a major negative effect on total charge time. If the current limit for the SYS output is reached (limited by the input current limit, or  $V_{IN-DPM}$ ), the charge current is reduced to provide the system with all the current that is needed. If the charge current is reduced to 0mA, pulling further current from SYS causes the output to fall to the battery voltage and enter supplement mode (see the *Dynamic Power Path Management* section for more details).

Once the battery is charged enough to where the system voltage begins to rise above  $V_{SYSREG}$  (depends on the charge current setting), the battery FET is turned on fully and the battery is charged with the charge current programmed using the ISET input,  $I_{CHARGE}$ . The slew rate for fast charge current is controlled to minimize the current and voltage over-shoot during transient. The charge current is programmed by connecting a resistor from ISET to GND. The value for  $R_{ISET}$  is calculated using [Equation 1](#):

$$R_{ISET} = \frac{K_{ISET}}{I_{CHARGE}} \quad (1)$$

Where  $I_{CHARGE}$  is the programmed fast charge current and  $K_{ISET}$  is the programming factor found in the Electrical Characteristics table.

The charger's constant current (CC) loop regulates the charge current to  $I_{CHARGE}$  until the battery reaches close to the regulation voltage. Once the battery voltage is close to the regulation voltage,  $V_{BATREG}$ , the charge current step downs sharply as the constant voltage (CV) loop takes over, the internal battery FET turns on full, tying SYS to BAT and the charger tapers down the charge current as shown in Figure 1. The voltage regulation feedback occurs by monitoring the battery-pack voltage between the BAT and PGND pins.

The bq24165/6/7 monitors the charging current during the voltage regulation phase. If the battery voltage is above the recharge threshold and the charge current has naturally tapered down to and remains below termination threshold,  $I_{TERM}$ , without disturbance from events like supplement mode for 32ms, the bq24165/6/7 terminates charge and turns off the battery charging FET. If  $V_{SYS} > V_{MINSYS}$  and the charge current has been reduced due to  $V_{INDPM}$ , the input current loop or thermal protection circuits or USB100mode, the charger disables termination. The system output is regulated to the  $V_{BAT(REG)}$  voltage and supports the full current available from the input. Battery supplement mode (see the *Dynamic Power Path Management* section for more details) is still available for SYS load transients. Supplement mode events occurring repeatedly within the 32ms deglitch window will prevent termination and can cause the charger to exit termination.

Charging resumes when one of the following conditions is detected:

1. The battery voltage falls below the  $V_{BAT(REG)} - V_{RCH}$  threshold
2.  $V_{SUPPLY}$  Power-on reset (POR)
3.  $\overline{CE1}$   $\overline{CE2}$  toggle or  $\overline{CE}$  toggle
4. Toggle Hi-Impedance mode (using IUSB\_)

A new charge cycle is initiated only in the event of  $V_{SUPPLY}$  POR or the battery being removed and replaced. If the battery voltage,  $V_{BAT}$ , is ever greater than  $V_{BATREG}$  (for example, when an almost fully charged battery enters the JEITA WARM state per the TS pin or  $\overline{CE1}$  and  $\overline{CE2}$  are configured to reduce  $V_{BATREG}$ ) but less than  $V_{BOVP}$ , the reverse boost protection circuitry may activate as explained later in this datasheet. If the battery is ever above  $V_{BOVP}$ , the buck converter turns off and the internal battery FET is turned on. This prevents further overcharging the battery and allows the battery to discharge to safe operating levels.

## BATTERY DETECTION

When termination conditions are met, a battery detection cycle is started. During battery detection,  $I_{\text{DETECT}}$  is pulled from VBAT for  $t_{\text{DETECT}}$  to verify there is a battery. If the battery voltage remains above  $V_{\text{DETECT}}$  for the full duration of  $t_{\text{DETECT}}$ , a battery is determined to present and the IC enters “Charge Done”. If VBAT falls below  $V_{\text{DETECT}}$ , battery detection continues. The next cycle of battery detection, the bq2416x turns on  $I_{\text{BATSHORT}}$  for  $t_{\text{DETECT}}$ . If VBAT rises to  $V_{\text{DETECT}}$ , the current source is turned off and after  $t_{\text{DETECT}}$ , the battery detection continues through another current sink cycle. Battery detection continues until charge is disabled or a battery is detected. Once a battery is detected, the fault status clears and a new charge cycle begins. Figures 6 and 7 show the oscillation on VBAT prior to battery insertion and after battery removal. Battery detection is disabled when termination is disabled.

## DYNAMIC POWER PATH MANAGEMENT

The bq24165/6/7 features a SYS output that powers the external system load connected to the battery. This output is active whenever a source is connected to IN, USB or BAT. The following sections discuss the behavior of SYS with a source connected to the supply (IN or USB) or a battery source only.

### INPUT SOURCE CONNECTED

When a source is connected to IN or USB, and the bq24165/6/7 is enabled, the buck converter starts up. If charging is enabled using  $\overline{\text{CE1}}$  and  $\overline{\text{CE2}}$  (bq24165) or  $\overline{\text{CE}}$  (bq24166/7), the charge cycle is initiated. When  $V_{\text{BAT}} > 3.5\text{V}$ , the internal battery FET is turned on and the SYS output is connected to  $V_{\text{BAT}}$ . If the SYS voltage falls to  $V_{\text{SYS(REG)}}$ , it is regulated to that point to maintain the system output even with a deeply discharged or absent battery. In this mode, the SYS output voltage is regulated by the buck converter and the battery FET is linearly regulated to regulate the charge current into the battery. The current from the supply is shared between charging the battery and powering the system load at SYS. The dynamic power path management (DPPM) circuitry of the bq24165/6/7 monitors the SYS voltage continuously. If  $V_{\text{SYS}}$  falls to  $V_{\text{MINSYS}}$ , the DPPM circuit adjusts charge current to maintain the load on SYS while preventing the system voltage from crashing. If the charge current is reduced to zero and the load increases further, the bq24165/6/7 enters battery supplement mode. During supplement mode, the battery FET is turned on and the battery supplements the system load. When the charge current is reduced by the DPPM regulation loop, the safety timer runs at half speed, so that it is twice as long. This prevents false safety timer faults. See the *Safety Timer* section for more details.

Figure 21. Example DPPM Response ( $V_{Supply} = 5\text{ V}$ ,  $V_{BAT} = 3.1\text{V}$ , 1.5A Input current limit)

If the  $V_{BAT(REG)}$  threshold is ever less than the battery voltage, the battery FET is turned off and the SYS output is regulated to  $V_{SYSREG(FETOFF)}$ . If the battery is ever 5% above the regulation threshold, the battery OVP circuit shuts the PWM converter off and the battery FET is turned on to discharge the battery to safe operating levels.

The input current limit for the USB input is set by the IUSB1, IUSB2, and IUSB3 inputs. The bq24165/6/7 incorporates all of the necessary input current limits to support USB2.0 and USB3.0 standards as well as 1.5A to support wall adapters. Driving IUSB1, IUSB2, and IUSB3 all high places the bq24165/6/7 in High Impedance mode where the buck converter is shutdown regardless if an input is connected to USB or IN. Table 1 shows the configuration for IUSB1 – IUSB3. When USB100 mode is selected, termination is disabled.

Table 1. USB1, USB2 and USB3 Input Table

IUSB3	IUSB2	IUSB1	Input Current Limit	$V_{INDPM}$ Threshold
0	0	0	100 mA	4.28 V
0	0	1	500 mA	4.44 V
0	1	0	1.5 A	4.44 V
0	1	1	High Impedance Mode	None
1	0	0	150 mA	4.28 V
1	0	1	900 mA	4.44 V
1	1	0	800 mA	4.44 V
1	1	1	High Impedance Mode	None

The input current limit for IN is programmable using the ILIM input. Connect a resistor from ILIM to GND to set the maximum input current limit. The programmable range for the IN input current limit is 1000mA to 2.5A.  $R_{ILIM}$  is calculated using Equation 2:

$$R_{ILIM} = \frac{K_{ILIM}}{I_{IN\_LIM}} \quad (2)$$

Where  $I_{IN\_LIM}$  is the programmed input current limit and  $K_{ILIM}$  is the programming factor found in the Electrical Characteristics table.

The bq24165/6/7 manages the dual input supply paths as well. The IN input has precedence when valid supplies are connected to both inputs. The two inputs are always isolated from one another. The bq24165/6/7 always seeks to charge from a valid source. For example, if a valid source is connected to USB and a source is connected to IN that is greater than the OVP threshold, the USB source is used to charge the battery. In this case, both the USB source and the battery would be isolated from the OVP source connected to the IN input.

## BATTERY ONLY CONNECTED

When the battery is connected with no input source, the internal battery FET is turned on similar to supplement mode. In this mode, the current is not regulated; however, there is a short circuit current limit. If the short circuit limit is reached, the battery FET is turned off for the deglitch time. After the deglitch time, the battery FET is turned on in order to determine if the short has been removed. If not, the FET turns off and the process repeats until the short is removed.

## EXTERNAL BATTERY DISCHARGE FET (BGATE)

The bq24165/6/7 contains a MOSFET driver to drive an external P-Channel MOSFET between the battery and the system output. This external FET provides a low impedance path to supply the system from the battery. Connect BGATE to the gate of the external discharge MOSFET. BGATE is on under the following conditions:

1. No valid input supply connected.
2. IUSB1=IUSB2=IUSB3=high (High Impedance Mode)

This FET is optional and runs in parallel with the internal charge FET during discharge. Note that this FET is not protected by the short circuit current limit.

## SAFETY TIMER

At the beginning of charging process, the bq24165/6/7 starts the 6 hour safety timer. This timer is active during the entire charging process. If charging has not terminated before the safety timer expires, the charge cycle is terminated and the battery FET is turned off. To clear the safety timer fault, charging must be resumed by using  $\overline{CE1}$  and  $\overline{CE2}$  (bq24165) or  $\overline{CE}$  (bq24166/7) or High Impedance mode or a new charge cycle started by  $V_{SUPPLY}$  POR or battery remove and replace.

During the fast charge (CC) phase, several events increase the timer duration by 2X.

1. The system load current reduces the available charging current.
2. The input current needed for the fast charge current is limited by the input current loop.
3. The input current is reduced because the  $V_{INDPM}$  loop is preventing the supply from crashing.
4. The device has entered thermal regulation because the IC junction temperature has exceeded  $T_{J(REG)}$ .
5. The CEx bits are reducing  $I_{CHARGE}$  or VBAT.
6. The battery voltage is less than  $V_{BATSHORT}$ .
7. The battery has entered the JEITA WARM or COLD state via the TS pin (bq24166/6) or  $\overline{CE1}/\overline{CE2}$  (bq24165) configuration.

During these events, the timer is slowed by half to extend the timer and prevent any false timer faults. Starting a new charge cycle by  $V_{SUPPLY}$  POR or removing/replacing the battery or resuming a charge by toggling the  $\overline{CE1}/\overline{CE2}$  (bq24165) or  $\overline{CE}$  (bq24166/7) pins, resets the safety timer. Additionally, thermal shutdown events cause the safety timer to reset.

## LDO OUTPUT (DRV)

The bq24165/6/7 contains a linear regulator (DRV) that is used to supply the internal MOSFET drivers and other circuitry. Additionally, DRV supplies up to 10mA external loads to power the STAT LED or the USB transceiver circuitry. The maximum value of the DRV output is 5.45V so it is ideal to protect voltage sensitive USB circuits. The LDO is on whenever a supply is connected to the IN or USB inputs of the bq24165/166. The DRV is disabled under the following conditions:

1.  $V_{SUPPLY} < UVLO$
2.  $V_{SUPPLY} - V_{BAT} < V_{SLP}$
3. Thermal Shutdown

## CHARGE PARAMETER SELECTOR INPUTS ( $\overline{CE1}$ , $\overline{CE2}$ , bq24165)

The  $\overline{CE1}$  and  $\overline{CE2}$  inputs allow the user to easily implement the JEITA standard for systems where the battery pack temperature is monitored by the host. JEITA requires that several temperatures be monitored and the maximum charge voltage or charge current be modified based on the battery voltage. A graphical representation of the JEITA specification is shown in Figure 22.

Figure 22. Charge Current During TS Conditions in Default Mode

In many systems, the battery temperature is monitored by the host and the information is used for several different operations. For these systems, the bq24165 method is ideal because it does not require the NTC in the battery to be shared amongst several different ICs. Instead, the  $\overline{CE1}$  and  $\overline{CE2}$  pins are driven by host GPIOs to reduce the charging current or charge voltage as required. This allows the host to decide which temperatures to change the charging profile and gives the ultimate flexibility to the user. Additionally,  $\overline{CE1}$  and  $\overline{CE2}$  are used to disable charging while not interfering with the main buck converter operation. The configuration table for  $\overline{CE1}$  and  $\overline{CE2}$  is shown in Table 2.

Table 2.  $\overline{CE1}$ ,  $\overline{CE2}$  Input Table

$\overline{CE1}$	$\overline{CE2}$	FUNCTION
0	0	Normal Charging
0	1	Charge current reduced by half
1	0	$V_{BAT(REG)}$ reduced to 4.06 V
1	1	Charging Suspended

## EXTERNAL NTC MONITORING (TS, bq24166/7)

The bq24166 and bq24167 provide a flexible, voltage based TS input for monitoring the battery pack NTC thermistor. The voltage at TS is monitored to determine that the battery is at a safe temperature during charging. For the bq24166, two temperature thresholds are monitored; the cold battery threshold ( $T_{NTC} < 0^{\circ}\text{C}$ ) and the hot battery threshold ( $T_{NTC} > 60^{\circ}\text{C}$ ). These temperatures correspond to the  $V_{COLD}$  and  $V_{HOT}$  thresholds. Charging is suspended and timers are suspended when  $V_{TS} < V_{HOT}$  or  $V_{TS} > V_{COLD}$ .

To satisfy the JEITA requirements, the bq24167 monitors four temperature thresholds; the cold battery threshold ( $T_{NTC} < 0^{\circ}\text{C}$ ), the cool battery threshold ( $0^{\circ}\text{C} < T_{NTC} < 10^{\circ}\text{C}$ ), the warm battery threshold ( $45^{\circ}\text{C} < T_{NTC} < 60^{\circ}\text{C}$ ) and the hot battery threshold ( $T_{NTC} > 60^{\circ}\text{C}$ ). These temperatures correspond to the  $V_{COLD}$ ,  $V_{COOL}$ ,  $V_{WARM}$ , and  $V_{HOT}$  thresholds. As with the bq24166, charging is suspended and timers are suspended when  $V_{TS} < V_{HOT}$  or  $V_{TS} > V_{COLD}$ . When  $V_{HOT} < V_{TS} < V_{WARM}$ , the battery regulation voltage is reduced by 140mV from the programmed regulation threshold. When  $V_{COOL} < V_{TS} < V_{COLD}$ , the charging current is reduced to half of the programmed charge current.

The TS function is voltage based for maximum flexibility. Connect a resistor divider from DRV to GND with TS connected to the center tap to set the threshold. The connections are shown in [Figure 24](#). The resistor values are calculated using the following equations:

$$RLO = \frac{V_{DRV} \times RCOLD \times RHOT \times \left[ \frac{1}{V_{COLD}} - \frac{1}{V_{HOT}} \right]}{RHOT \times \left[ \frac{V_{DRV}}{V_{HOT}} - 1 \right] - RCOLD \times \left[ \frac{V_{DRV}}{V_{COLD}} - 1 \right]} \quad (3)$$

$$RHI = \frac{\frac{V_{DRV}}{V_{COLD}} - 1}{\frac{1}{RLO} + \frac{1}{RCOLD}} \quad (4)$$

Where:

$$V_{COLD} = 0.60 \times V_{DRV}$$

$$V_{HOT} = 0.30 \times V_{DRV}$$

Where RHOT is the NTC resistance at the hot temperature and RCOLD is the NTC resistance at cold temperature.

For the bq24167, the WARM and COOL thresholds are not independently programmable. The COOL and WARM NTC resistances for a selected resistor divider are calculated using the following equations:

$$RCOOL = \frac{RLO \times 0.564 \times RHI}{RLO - RLO \times 0.564 - RHI \times 0.564} \quad (5)$$

$$RWARM = \frac{RLO \times 0.383 \times RHI}{RLO - RLO \times 0.383 - RHI \times 0.383} \quad (6)$$

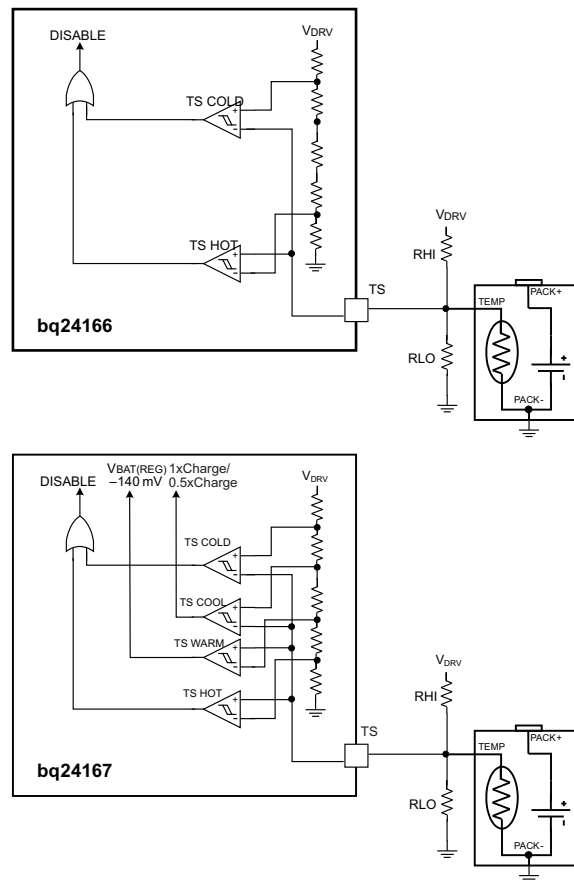

Figure 23. TS Circuits

## THERMAL REGULATION AND PROTECTION

During the charging process, to prevent the IC from overheating, bq24165/6/7 monitors the junction temperature,  $T_J$ , of the die and begins to taper down the charge current once  $T_J$  reaches the thermal regulation threshold,  $T_{CF}$ . The charge current is reduced to zero when the junction temperature increases about  $10^\circ\text{C}$  above  $T_{CF}$ . Once the charge current is reduced, the system current is reduced while the battery supplements the load to supply the system. This may cause a thermal shutdown of the bq24165/6/7 if the die temperature rises too high. At any state, if  $T_J$  exceeds  $T_{SHTDWN}$ , bq24165/6/7 suspends charging and disables the buck converter. During thermal shutdown mode, PWM is turned off, and the timer is reset. The charging cycle resets when  $T_J$  falls below  $T_{SHTDWN}$  by approximately  $10^\circ\text{C}$ .

## INPUT VOLTAGE PROTECTION IN CHARGE MODE

### Sleep Mode

The bq24165/6/7 enters the low-power sleep mode if the voltage on  $V_{SUPPLY}$  falls below sleep-mode entry threshold,  $V_{BAT}+V_{SLP}$ , and  $V_{SUPPLY}$  is higher than the undervoltage lockout threshold,  $V_{UVLO}$ . This feature prevents draining the battery during the absence of  $V_{SUPPLY}$ . When  $V_{SUPPLY} < V_{BAT}+V_{SLP}$ , the bq24165/6/7 turns off the PWM converter, and turns the battery FET and BGATE on. Once  $V_{SUPPLY} > V_{BAT}+V_{SLP}$ , the device initiates a new charge cycle.

### Input Voltage Based DPM

During normal charging process, if the input power source is not able to support the programmed or default charging current, the supply voltage decreases. Once the supply drops to  $V_{IN\_DPM}$  (set by IUSB\_ for USB input or VDPM for IN input), the input current limit is reduced down to prevent the further drop of the supply. This feature ensures IC compatibility with adapters with different current capabilities without a hardware change. Figure 24 shows the  $V_{IN}$ -DPM behavior to a current limited source. In this figure the input source has a 750mA current limit and the charging is set to 750mA. The SYS load is then increased to 1.2A.

Figure 24. bq2416x  $V_{IN}$ -DPM

The  $V_{IN}$ -DPM threshold for the IN input is set using a resistor divider with VDPM connected to the center tap. Select 10k $\Omega$  for the bottom resistor. The top resistor is selected using the following equation:

$$R_{TOP} = \frac{10 \text{ k}\Omega \times (V_{INDPM} - V_{DPM})}{V_{DPM}} \quad (7)$$

Where  $V_{INDPM}$  is the desired  $V_{INDPM}$  threshold and  $V_{DPM}$  is the regulation threshold specified in the Electrical Characteristics table. For the QFN packaged ICs, a small capacitance (10pF-100pF) from the VDPM pin to ground may be added if the resistor divider from VIN to VDPM is not placed close to the IC pins, thereby causing significant noise on the VDPM pin.

### Bad Source Detection

When a source is connected to IN or USB, the bq2416x runs a Bad Source Detection procedure to determine if the source is strong enough to provide some current to charge the battery. A current sink is turned on (30mA for USB input, 75mA for the IN input) for 32ms. After the 32ms, if the input source is above  $V_{BADSOURCE}$  plus hysteresis, where  $V_{BADSOURCE}$  is the user set  $V_{INDPM}$  threshold, the buck converter starts up and normal operation continues. If the supply voltage falls below  $V_{BADSOURCE}$  less hysteresis during the detection, the current sink shuts off for two seconds and then retries. The detection circuit retries continuously until either a new source is connected to the other input or a valid source is detected after the detection time. If during normal operation the source falls to  $V_{BAD\_SOURCE}$ , the bq2416x turns off the PWM converter, turns the battery FET on. Once a good source is detected, the device returns to normal operation.

If two supplies are connected, the IN supply is checked first. If the supply detection fails once, the device switches to USB for two seconds and then retries IN. This allows the supply to settle if the connection was jittery or the supply ramp was too slow to pass detection. If the supply fails the detection twice, it is locked out and the USB supply is used. Once the bad supply is locked out, it remains locked out until the supply voltage falls below UVLO. This prevents continuously switching between a weak supply and a good supply.

### Input Over-Voltage Protection

The bq24165/6/7 provides over-voltage protection on the input that protects downstream circuitry. The built-in input over-voltage protection to protect the device and other components against damage from overvoltage on the input supply (Voltage from  $V_{USB}$  or  $V_{IN}$  to PGND). When  $V_{SUPPLY} > V_{OVP}$ , the bq24165/6/7 turns off the PWM converter, suspends the charging cycle and turns the battery FET and BGATE on. Once the OVP fault is removed, the device returns to the operation it was in prior to the OVP fault.

### Reverse Boost (Boost Back) Prevention Circuit

Figure 25. Reverse Boost

A buck converter has two operating states, continuous conduction mode (CCM) and discontinuous conduction mode (DCM). In DCM, the inductor current ramps down to zero during the switching cycle while in CCM the inductor maintains a DC level of current. Transitioning from DCM to CCM during load transients, slows down the converter's transient response for those load steps, which can result in the SYS rail drooping. To achieve the fastest possible transient response for this charger, this charger's synchronous buck converter is forced to run in CCM even at light loads when the buck converter would typically revert to DCM. The challenge that presents itself when forcing CCM with a charger is that the output of the buck converter now has a power source. Thus, if the battery voltage,  $V_{BAT}$ , is ever greater than  $V_{BATREG}$ , the inductor current goes fully negative and pushes current back to the input supply. This effect causes the input source voltage to rise if the input source cannot sink current. The input over-voltage protection circuit protects the IC from damage however some input sources may be damaged if the voltage rises. To prevent this, this charger has implemented a reverse boost prevention circuit. When reverse current is sensed that is not a result of the supplement comparator tripping, this circuit disables the internal battery FET and changes the feedback point to  $V_{SYSREG}$  for 1ms. After the 1ms timeout, the BATFET is turned on again and the battery is tested to see if it is higher than  $V_{BATREG}$  (negative current). The reverse current protection is only active when  $V_{BOVP} > V_{BAT} > V_{BATREG} - V_{RCH}$ . Having  $V_{BOVP} > V_{BAT} > V_{BATREG} - V_{RCH}$  and termination disabled (e.g., when  $CE1 = 1$  and  $CE2 = 0$  but  $V_{BAT} > 4.06V$ ) results in an approximately 100mV, 1000Hz ripple on SYS as seen in Figure 25. With termination enabled and  $ITERM > 150mA$  or with a high line impedance to the battery, the likelihood of activating reverse boost protection circuit is greatly reduced even if  $V_{BAT} > V_{BATREG} - V_{RCH}$ . The IC stops charging and can exit charge done after entering reverse boost due to a SYS load transient causing a battery supplement event. Charging resumes after  $V_{BAT}$  drops below  $V_{BATREG} - V_{RCH}$ . Therefore, large SYS load transients may result in the battery reaching slightly less than full charge.

## STATUS INDICATORS ( $\overline{\text{CHG}}$ , $\overline{\text{PG}}$ )

The bq24165/6/7 contains two open-drain outputs that signal its status. The  $\overline{\text{PG}}$  output indicates that a valid input source is connected to USB or IN.  $\overline{\text{PG}}$  is low when  $V_{\text{SUPPLY}} > V_{\text{UVLO}}$  AND  $(V_{\text{BAT}} + V_{\text{SLP}}) < V_{\text{SUPPLY}} < V_{\text{OVP}}$ . When there is no supply connected to either input within this range,  $\overline{\text{PG}}$  is high impedance. [Table 3](#) illustrates the  $\overline{\text{PG}}$  behavior under different conditions.

During new charge cycles, the  $\overline{\text{CHG}}$  output goes low to indicate a new charge cycle is in progress or that charge has been suspended due to a TS pin fault or the thermal protection circuit. A new charge cycle is initiated by removing and replacing the battery or toggling the input power.  $\overline{\text{CHG}}$  remains low until charge termination unless the battery is removed, there is a timer fault or the input supply is no longer valid. After termination of the new charge cycle,  $\overline{\text{CHG}}$  remains high impedance until a new charge cycle is initiated.  $\overline{\text{CHG}}$  does not go low during recharge cycles. [Table 4](#) illustrates the  $\overline{\text{CHG}}$  behavior under different conditions.

Connect  $\overline{\text{PG}}$  and  $\overline{\text{CHG}}$  to the DRV output through an LED for visual indication, or connect through a 100k $\Omega$  pullup to the required logic rail for host indication.

**Table 3.  $\overline{\text{PG}}$  Status Indicator**

CHARGE STATE	$\overline{\text{PG}}$ BEHAVIOR
$V_{\text{SUPPLY}} < V_{\text{UVLO}}$	High-Impedance
$V_{\text{SUPPLY}} < (V_{\text{BAT}} + V_{\text{SLP}})$	High-Impedance
$(V_{\text{BAT}} + V_{\text{SLP}}) < V_{\text{SUPPLY}} < V_{\text{OVP}}$	Low
$V_{\text{SUPPLY}} > V_{\text{OVP}}$	High-Impedance

**Table 4.  $\overline{\text{CHG}}$  Status Indicator**

CHARGE STATE	$\overline{\text{CHG}}$ BEHAVIOR
New Charge Cycle in progress	Low (first charge cycle)
Charging suspend by TS fault	High-Impedance (recharge cycles)
Charging suspended by thermal loop	
New Cycle Charge Done	
Recharge Cycle after Termination	
Timer Fault	High-Impedance
No Valid Supply	
No Battery Present	

## APPLICATION INFORMATION

### OUTPUT INDUCTOR AND CAPACITOR SELECTION GUIDELINES

When selecting an inductor, several attributes must be examined to find the right part for the application. First, the inductance value should be selected. The bq2416x is designed to work with 1.5µH to 2.2µH inductors. The chosen value will have an effect on efficiency and package size. Due to the smaller current ripple, some efficiency gain is reached using the 2.2µH inductor, however, due to the physical size of the inductor, this may not be a viable option. The 1.5µH inductor provides a good tradeoff between size and efficiency.

Once the inductance has been selected, the peak current must be calculated in order to choose the current rating of the inductor. Use [Equation 8](#) to calculate the peak current.

$$I_{PEAK} = I_{LOAD(MAX)} \times \left( 1 + \frac{\%RIPPLE}{2} \right) \quad (8)$$

The inductor selected must have a saturation current rating higher than the calculated  $I_{PEAK}$ . Due to the high currents possible with the bq2416x, a thermal analysis must also be done for the inductor. Many inductors have 40°C temperature rise rating. This is the DC current that will cause a 40°C temperature rise above the ambient temperature in the inductor. For this analysis, the typical load current may be used adjusted for the duty cycle of the load transients. For example, if the application requires a 1.5A DC load with peaks at 2.5A for 20% of the time, a  $\Delta 40^\circ\text{C}$  temperature rise current must be greater than 1.7A:

$$I_{TEMPRISE} = I_{LOAD} + D \times (I_{PEAK} - I_{LOAD}) = 1.5 \text{ A} + 0.2 \times (2.5 \text{ A} - 1.5 \text{ A}) = 1.7 \text{ A}$$

The bq2416x provides internal loop compensation. Using this scheme, the bq2416x is stable with 10µF to 200µF of local capacitance. The capacitance on the SYS rail can be higher if distributed amongst the rail. To reduce the output voltage ripple, a ceramic capacitor with the capacitance between 10µF and 47µF is recommended for local bypass to SYS. A 47µF bypass capacitance on SYS is recommended to optimize the transient response.

### PCB LAYOUT GUIDELINES

It is important to pay special attention to the PCB layout. [Figure 26](#) provides a sample layout for the high current paths of the bq2416x.

**Figure 26. Recommended bq2416x PCB Layout**

The following provides some guidelines:

- To obtain optimal performance, the power input capacitors, connected from the PMID input to PGND, must be placed as close as possible to the bq2416x
- The layout between BAT and the positive connector of the battery should be as short as possible to minimize resistance and inductance. If the parasitic inductance is expected to be significant, the bypass capacitance on BAT should be increased.
- Place 4.7 $\mu$ F input capacitor as close to PMID pin and PGND pin as possible to make high frequency current loop area as small as possible. Place 1 $\mu$ F input capacitor GNDs as close to the respective PMID cap GND and PGND pins as possible to minimize the ground difference between the input and PMID\_.
- The local bypass capacitor from SYS to GND should be connected between the SYS pin and PGND of the IC. The intent is to minimize the current path loop area from the SW pin through the LC filter and back to the PGND pin.
- Place ISET and ILIM resistors very close to their respective IC pins.
- Place all decoupling capacitor close to their respective IC pin and as close as to PGND (do not place components such that routing interrupts power stage currents). All small control signals should be routed away from the high current paths.
- The PCB should have a ground plane (return) connected directly to the return of all components through vias (two vias per capacitor for power-stage capacitors, one via per capacitor for small-signal components). It is also recommended to put vias inside the PGND pads for the IC, if possible. A star ground design approach is typically used to keep circuit block currents isolated (high-power/low-power small-signal) which reduces noise-coupling and ground-bounce issues. A single ground plane for this design gives good results. With this small layout and a single ground plane, there is no ground-bounce issue, and having the components segregated minimizes coupling between signals.
- The high-current charge paths into IN, USB, BAT, SYS and from the SW pins must be sized appropriately for the maximum charge current in order to avoid voltage drops in these traces. The PGND pins should be connected to the ground plane to return current through the internal low-side FET.
- For high-current applications, the balls for the power paths should be connected to as much copper in the board as possible. This allows better thermal performance as the board pulls heat away from the IC.

## PACKAGE SUMMARY

O - Pin A1 Marker  
 TI - Texas Instruments Letters  
 YM - Year Month Date Code  
 LLLL - Lot Trace Code  
 S - Assembly Site Code

## CHIP SCALE PACKAGING DIMENSIONS

The bq2416x devices are available in a 49-bump chip scale package (YFF, NanoFree™).  
 The package dimensions are:

- D = 2.78mm ±0.05mm
- E = 2.78mm ±0.05mm

## REVISION HISTORY

Changes from Original (December 2011) to Revision A	Page
• Changed in ELECTRICAL CHARACTERISTICS, in row $V_{IN\_DPM\_USB}$ , min, typ, max columns, from 4.55 to 4.35, 4.68 to 4.44 and 4.77 to 4.52 (had been changed) .....	5
• Changed $I_{LIMIT}$ max from 2.5 A to 5.6 A .....	5
• Changed <a href="#">Table 1</a> , last column, all 4.68 V to 4.44 V .....	17

---

Changes from Revision A (March 2012) to Revision B	Page
• Added <a href="#">Figure 25</a> .....	23

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of  $\leq 1000$ ppm threshold. Antimony trioxide based flame retardants must also meet the  $\leq 1000$ ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
