

用于水计量应用的 MSP430FR604x(1)、MSP430FR603x(1)、超声波感应 MSP430™ 微控制器

1 器件概述

1.1 特性

- 具有超低功耗的一流超声波水流量测量
 - 差分飞行时间 (dTOF) 精度小于 25ps
 - 高精度时间测量分辨率小于 5ps
 - 能够检测低流速 (<1 升/小时)
 - 在每秒测量一次的频率下总体电流消耗大约为 3 μ A
- 符合并超出 ISO 4064、OIML R49 和 EN 1434 精度标准
- 能够直接与标准超声波传感器 (高达 2.5MHz) 连接
- 集成模拟前端 – 超声波感应解决方案 (USS)
 - 可在不同频率下生成脉冲的可编程脉冲生成 (PPG)
 - 具有低阻抗 (4 Ω) 输出驱动器的集成物理接口 (PHY), 可控制输入和输出通道
 - 具有高达 8Msps 输出数据速率的高性能高速 12 位 Σ - Δ ADC (SDHS)
 - 具有 -6.5dB 至 30.8dB 增益的可编程增益放大器 (PGA)
 - 输出范围为 68MHz 至 80MHz 的高性能锁相环 (PLL)
- 计量测试接口 (MTIF)
 - 脉冲发生器和脉冲计数器
 - 高达 1016 次脉冲/秒 (p/s) 的脉冲率
 - 计数容量高达 65535 (16 位)
 - 在 LPM3.5 下以 200nA (典型值) 运行
- 低能耗加速器 (LEA)
 - 独立于 CPU 运行
 - 与 CPU 共享 4KB RAM
 - 256 点高效复变 FFT: 比 Arm® Cortex®-M0+ 内核快多达 40 倍
- 嵌入式微控制器
 - 高达 16MHz 时钟频率的 16 位 RISC 架构
 - 3.6V 至 1.8V 的宽电源电压范围 (最低电源电压受限于 SVS 电平, 请参阅 [SVS 规格](#))
- 经优化的超低功耗模式
 - 工作模式: 大约 120 μ A/MHz
 - 待机模式下的实时时钟 (RTC) (LPM3.5): 450nA⁽¹⁾
 - 关断电流 (LPM4.5): 30nA
- 铁电随机存取存储器 (FRAM)
 - 高达 256KB 的非易失性存储器
 - 超低功耗写入
 - 125ns 每个字的快速写入 (4ms 内写入 64KB)
 - 统一标准存储器 = 单个空间内的程序 + 数据 + 存储
 - 10¹⁵ 写入周期持久性
 - 抗辐射和非磁性
- 智能数字外设
 - 32 位硬件乘法器 (MPY)
 - 6 通道内部直接存储器访问 (DMA)
 - 具备日历和报警功能的 RTC
 - 六个 16 位定时器, 每个定时器具有多达七个捕捉/比较寄存器
 - 32 位和 16 位循环冗余校验 (CRC)
- 高性能模拟
 - 16 通道模拟比较器
 - 12 位 SAR ADC, 具有窗口比较器、内部基准和采样保持功能以及多达 16 条外部输入通道
 - 具有高达 264 段对比度控制的集成 LCD 驱动器
- 多功能输入/输出端口
 - 可每位、每字节和每字访问 (成对访问)
 - 所有端口上, 从 LPM 中的边沿可选唤醒
 - 所有端口上可编程上拉和下拉
- 代码安全性和加密
 - 128 位或 256 位高级加密标准 (AES) 安全加密和解密协处理器
 - 针对随机数生成算法的随机数种子
 - IP 封装防止对存储器进行外部访问
 - FRAM 可提供固有安全性优势

(1) RTC 由 3.7pF 晶振生成。

- 增强型串行通信
 - 多达四个 eUSCI_A 串行通信端口
 - 支持自动波特率侦测的通用异步收发器 (UART)
 - IrDA 编码和解码
 - 多达两个 eUSCI_B 串行通信端口
 - 支持多从设备寻址的 I²C
 - 硬件通用异步收发器 (UART) 或 I²C 自举程序 (BSL)
- 灵活时钟系统
 - 具有 10 个可选厂家调整频率的定频数控振荡器 (DCO)
 - 低功率低频内部时钟源 (VLO)
 - 32kHz 晶振 (LFXT)
- 高频晶振 (HFXT)
- 开发工具和软件 (另请参阅 [工具和软件](#))
 - 超声波感应设计中心图形用户界面
 - 超声波感应软件库
 - EVM430-FR6047 水表评估模块板
 - 用于 100 引脚封装的 MSP-TS430PZ100E 目标插座板
 - 采用 EnergyTrace++ 技术的免费专业开发环境
 - 用于 MSP430™ 微控制器的 MSP430Ware™
- [器件比较](#) 汇总了可用的器件型号和封装选项

1.2 应用

- 超声波智能水表
- 超声波智能热量计
- 液位感应
- 漏水检测

1.3 说明

德州仪器 (TI) MSP430FR604x 和 MSP430FR603x 系列超声波感应和测量 SoC 是针对水表和热量计进行了优化的强大且高度集成的微控制器 (MCU)。MSP430FR604x MCU 具有集成的超声波感应解决方案 (USS) 模块, 该模块可在多种流速条件下提供高精度。USS 模块高度集成, 需要的外部组件极少, 因而有助于实现超低功耗计量并降低系统成本。MSP430FR604x 和 MSP430FR603x MCU 采用集成式低功耗加速器 (LEA), 可实现基于高速 ADC 的信号采集以及后续优化数字信号处理, 为电池供电型计量应用提供了一款理想的超低功耗、高精度计量 解决方案。

USS 模块包括可编程脉冲发生器 (PPG) 和具有低阻抗输出驱动器的物理接口 (PHY), 以实现最佳传感器激励和准确的阻抗匹配, 从而在零流量漂移 (ZFD) 方面达到最佳效果。该模块还包含可编程增益放大器 (PGA) 和高速 12 位 8MSPS Σ - Δ ADC (SDHS), 便于通过行业标准超声波传感器实现精确的信号采集。

此外, MSP430FR604x 和 MSP430FR603x MCU 还集成了其他外设, 可提高系统在计量方面的集成度。这些器件还具有计量测试接口 (MTIF) 模块, 能够通过脉冲生成来指示仪表测量的流量。MSP430FR604x 和 MSP430FR603x MCU 还具有片上 8 通道多路复用器 LCD 驱动器、RTC、12 位 SAR ADC、模拟比较器、高级加密加速器 (AES256) 和循环冗余校验 (CRC) 模块。

MSP430FR604x 和 MSP430FR603x MCU 由一款广泛的硬件和软件生态系统提供支持, 随附参考设计和代码示例, 以使用户快速开展设计。开发套件包括 [MSP-TS430PZ100E 100 引脚目标开发板](#)和 [EVM430-FR6047 超声波水流量计 EVM](#)。TI 还提供免费软件, 包括超声波感应设计中心、超声波感应软件库和 [MSP430Ware™ 软件](#)。

TI 的 MSP430 超低功耗 (ULP) FRAM 微控制器平台将独特的嵌入式 FRAM 和全面的超低功耗系统架构相结合, 从而使系统设计人员能够在降低能耗的同时提升性能。FRAM 技术将 RAM 的低能耗快速写入、灵活性和耐用性与闪存的非易失性相结合。

- (1) For the most current package and ordering information, see the *Package Option Addendum* in 节 9, or see the TI website at www.ti.com.
- (2) Package drawings, standard packing quantities, thermal data, symbolization, and PCB design guidelines are available at www.ti.com/packaging.
- (3) Each number in the sequence represents an instantiation of Timer_A with its associated number of capture/compare registers and PWM output generators available. For example, a number sequence of 3, 5 would represent two instantiations of Timer_A, the first instantiation having three capture/compare registers and PWM output generators and the second instantiation having five capture/compare registers and PWM output generators, respectively.
- (4) Each number in the sequence represents an instantiation of Timer_B with its associated number of capture/compare registers and PWM output generators available. For example, a number sequence of 3, 5 would represent two instantiations of Timer_B, the first instantiation having three capture/compare registers and PWM output generators and the second instantiation having five capture/compare registers and PWM output generators, respectively.
- (5) eUSCI_A supports UART with automatic baud-rate detection, IrDA encode and decode, and SPI.
- (6) eUSCI_B supports I²C with multiple slave addresses and SPI.
- (7) Timers TA0 and TA1 provide internal and external capture/compare inputs and internal and external PWM outputs.
- (8) Timers TA2 and TA3 provide only internal capture/compare inputs and only internal PWM outputs (if any) whereas Timer TA4 provides internal, external capture/compare inputs and internal, external PWM outputs.

4.4 Pin Multiplexing

Pin multiplexing for these devices is controlled by both register settings and operating modes (for example, if the device is in test mode). For details of the settings for each pin and diagrams of the multiplexed ports, see [节 6.14](#).

4.5 Buffer Type

[表 4-3](#) describes the buffer types that are referenced in [表 4-1](#).

表 4-3. Buffer Type

$\overline{\text{RST}}$ /NMI/SBWD IO	DV _{CC} or V _{CC}	47-k Ω pullup or internal pullup selected with 10-nF (2.2-nF ⁽²⁾) pulldown
PJ.0/TDO PJ.1/TDI PJ.2/TMS PJ.3/TCK	Open	The JTAG pins are shared with general-purpose I/O function (PJ.x). If these pins are not used, set them to port function, output direction. If used as JTAG pins, leave them open.
TEST	Open	This pin always has an internal pulldown enabled.

(1) For any unused pin with a secondary function that is shared with general-purpose I/O, follow the guidelines for the Px.0 to Px.7 pins.

(2) The pulldown capacitor must not exceed 2.2 nF when using devices with Spy-Bi-Wire interface in Spy-Bi-Wire mode or in 4-wire JTAG mode with TI tools like FET interfaces or GANG programmers.

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

			MIN	MAX	UNIT
V _{CC}	Supply voltage ⁽²⁾	At DVCC and AVCC pins	-0.3	4.1	V
		At DVCC, AVCC, and PVCC pins	-0.3	4.1	
		Voltage difference between DVCC and AVCC pins ⁽³⁾		±0.3	V
		Voltage difference among DVCC, AVCC, and PVCC pins ⁽³⁾		±0.3	V
V _I	Input voltage ⁽²⁾	Applied to CHx_IN	-0.3	1.65	V
		Applied to CHx_IN with a duty cycle of 10% over 1 ms	-0.3	1.8	
		Applied to USSXTIN (USSXTOUT)	-0.3	1.5	
		Applied to any other pin	-0.3	V _{CC} + 0.3 V (4.1 V Max)	
		Diode current at any device pin		±2	mA
T _{stg}	Storage temperature ⁽⁴⁾		-40	125	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Voltages are referenced to V_{SS}.
- (3) Voltage differences between DVCC and AVCC that exceed the specified limits can cause malfunction of the device including erroneous writes to RAM and FRAM.
- (4) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

5.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge (all except CHx_OUT terminals)	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±250	
V _(ESD)	Electrostatic discharge (on CHx_OUT terminals)	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±250	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±1000 V may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±250 V may actually have higher performance.

5.3 Recommended Operating Conditions

TYP data are based on $V_{CC} = 3.0\text{ V}$ and $T_A = 25^\circ\text{C}$ (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage range applied at all DVCC and AVCC pins ⁽¹⁾ ⁽²⁾ ⁽³⁾ ⁽⁴⁾	1.8 ⁽⁵⁾		3.6	V
V_{CC}	Supply voltage range applied at PVCC pin ⁽¹⁾	2.2		3.6	V
V_{SS}	Supply voltage applied at all DVSS, AVSS, and PVSS pins		0		V
T_A	Operating free-air temperature	-40		85	°C
C_{DVCC}	Capacitor value at DVCC ⁽⁶⁾	1 – 20%			µF
f_{SYSTEM}	Processor frequency (maximum MCLK frequency) ⁽⁷⁾	No FRAM wait states (NWAITSx = 0)	0	8 ⁽⁸⁾	MHz
		With FRAM wait states (NWAITSx = 1) ⁽⁹⁾	0	16 ⁽¹⁰⁾	
f_{LEA}	LEA processor frequency	0		16 ⁽¹⁰⁾	
f_{ACLK}	Maximum ACLK frequency			50	kHz
f_{SMCLK}	Maximum SMCLK frequency			16 ⁽¹⁰⁾	MHz

- (1) TI recommends powering the AVCC, DVCC, PVCC pins from the same source. At a minimum, during power up, power down, and device operation, the voltage difference among AVCC, DVCC, PVCC must not exceed the limits specified in *Absolute Maximum Ratings*. Exceeding the specified limits can cause malfunction of the device including erroneous writes to RAM and FRAM.
- (2) Fast supply voltage changes can trigger a BOR reset even within the recommended supply voltage range. To avoid unwanted BOR resets, the supply voltage must change by less than 0.05 V per microsecond ($\pm 0.05\text{ V}/\mu\text{s}$). Following the recommendation for capacitor C_{DVCC} should limit the slopes accordingly.
- (3) Modules may have a different supply voltage range specification. See the specification of the respective module in this data sheet.
- (4) The USS module must be disabled if AVCC and DVCC are lower than 2.2 V.
- (5) The minimum supply voltage is defined by the supervisor SVS levels. See the PMM SVS threshold parameters for the exact values.
- (6) As a decoupling capacitor for each supply pin pair (DVCC and DVSS or AVCC and AVSS), place a low-ESR 100-nF (minimum) ceramic capacitor as close as possible (within a few millimeters) to the respective pin pairs. For the PVCC and PVSS pair, place a low-ESR 22-µF (minimum) ceramic capacitor as close as possible (within a few millimeters) to the pin pair.
- (7) Modules may have a different maximum input clock specification. See the specification of each module in this data sheet.
- (8) DCO settings and HF crystals with a typical value less than or equal to the specified MAX value are permitted.
- (9) Wait states occur only on actual FRAM accesses; that is, on FRAM cache misses. RAM and peripheral accesses are always executed without wait states.
- (10) DCO settings and HF crystals with a typical value less than or equal to the specified MAX value are permitted. If a clock source with a higher typical value is used, the clock must be divided in the clock system.

(1) All inputs are tied to 0 V or to V_{CC} . Outputs do not source or sink any current.

(2) Characterized with program executing typical data processing.

$f_{ACLK} = 32768$ Hz, $f_{MCLK} = f_{SMCLK} = f_{DCO}$ at specified frequency, except for 12 MHz. For 12 MHz, $f_{DCO} = 24$ MHz and $f_{MCLK} = f_{SMCLK} = f_{DCO}/2$.

At MCLK frequencies above 8 MHz, the FRAM requires wait states. When wait states are required, the effective MCLK frequency ($f_{MCLK,eff}$) decreases. The effective MCLK frequency also depends on the cache hit ratio. SMCLK is not affected by the number of wait states or the cache hit ratio.

The following equation can be used to compute $f_{MCLK,eff}$:

$$f_{MCLK,eff} = f_{MCLK} / [\text{wait states} \times (1 - \text{cache hit ratio}) + 1]$$

For example, with 1 wait state and 75% cache hit ratio, $f_{MCLK,eff} = f_{MCLK} / [1 \times (1 - 0.75) + 1] = f_{MCLK} / 1.25$.

(3) Represents typical program execution. Program and data reside entirely in FRAM. All execution is from FRAM.

(4) Program resides in FRAM. Data resides in SRAM. Average current dissipation varies with cache hit-to-miss ratio as specified. Cache hit ratio represents number cache accesses divided by the total number of FRAM accesses. For example, a 75% ratio implies three of every four accesses is from cache, and the remaining are FRAM accesses.

(5) See for typical curves. Each characteristic equation shown in the graph is computed using the least squares method for best linear fit using the typical data shown in [Section 5.4](#).

(6) Program and data reside entirely in RAM. All execution is from RAM.

(7) Program and data reside entirely in RAM. All execution is from RAM. FRAM is off.

5.5 Typical Characteristics, Active Mode Supply Currents

- A. $I_{(AM,cache\ hit\ ratio)}$: Program resides in FRAM. Data resides in SRAM. Average current dissipation varies with cache hit-to-miss ratio as specified. Cache hit ratio represents number cache accesses divided by the total number of FRAM accesses. For example, a 75% ratio implies three of every four accesses is from cache, and the remaining are FRAM accesses.
- B. $I_{(AM,RAMonly)}$: Program and data reside entirely in RAM. All execution is from RAM. FRAM is off.

5.13 Timing and Switching Characteristics

5.13.1 Power Supply Sequencing

TI recommends powering the AVCC, DVCC, and PVCC pins from the same source. At a minimum, during power up, power down, and device operation, the voltage difference among AVCC, DVCC, and PVCC must not exceed the limits specified in [Section 5.1](#). Exceeding the specified limits can cause malfunction of the device including erroneous writes to RAM and FRAM.

[表 5-1](#) lists the power ramp requirements for brownout and power up.

表 5-1. Brownout and Device Reset Power Ramp Requirements

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
V _{VCC_BOR-}	Brownout power-down level ⁽¹⁾	dV _{CC} /dt < 3 V/s	0.7	1.66	V
V _{VCC_BOR+}	Brownout power-up level ⁽¹⁾	dV _{CC} /dt < 3 V/s ⁽²⁾	0.79	1.68	V

- (1) Fast supply voltage changes can trigger a BOR reset even within the recommended supply voltage range. To avoid unwanted BOR resets, the supply voltage must change by less than 0.05 V per microsecond (± 0.05 V/ μ s). Following the recommendation for capacitor C_{DVCC} should limit the slopes accordingly.
- (2) The brownout levels are measured with a slowly changing supply.

- (1) To improve EMI on the LFXT oscillator, observe the following guidelines:
 - Keep the trace between the device and the crystal as short as possible.
 - Design a good ground plane around the oscillator pins.
 - Prevent crosstalk from other clock or data lines into oscillator pins LFXIN and LFXOUT.
 - Avoid running PCB traces underneath or adjacent to the LFXIN and LFXOUT pins.
 - Use assembly materials and processes that avoid any parasitic load on the oscillator LFXIN and LFXOUT pins.
 - If conformal coating is used, ensure that it does not induce capacitive or resistive leakage between the oscillator pins.
- (2) When LFXTBYPASS is set, LFXT circuits are automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-trigger Inputs section of this data sheet. Duty cycle requirements are defined by DC_{LFXT, SW}.
- (3) Maximum frequency of operation of the entire device cannot be exceeded.
- (4) Oscillation allowance is based on a safety factor of 5 for recommended crystals. The oscillation allowance is a function of the LFXTDRIVE settings and the effective load. In general, comparable oscillator allowance can be achieved based on the following guidelines, but should be evaluated based on the actual crystal selected for the application:
 - For LFXTDRIVE = {0}, C_{L,eff} = 3.7 pF
 - For LFXTDRIVE = {1}, C_{L,eff} = 6 pF
 - For LFXTDRIVE = {2}, 6 pF ≤ C_{L,eff} ≤ 9 pF
 - For LFXTDRIVE = {3}, 9 pF ≤ C_{L,eff} ≤ 12.5 pF

f _{Fault,LFXT}	Oscillator fault frequency ^{(8) (9)}			0		3500	Hz

- (5) This represents all the parasitic capacitance present at the LFXIN and LFXOUT terminals, respectively, including parasitic bond and package capacitance. The effective load capacitance, C_{L,eff} can be computed as C_{IN} × C_{OUT} / (C_{IN} + C_{OUT}), where C_{IN} and C_{OUT} is the total capacitance at the LFXIN and LFXOUT terminals, respectively.
- (6) Requires external capacitors at both terminals to meet the effective load capacitance specified by crystal manufacturers. Recommended effective load capacitance values supported are 3.7 pF, 6 pF, 9 pF, and 12.5 pF. Maximum shunt capacitance of 1.6 pF. The PCB adds additional capacitance, so it must also be considered in the overall capacitance. Verify that the recommended effective load capacitance of the selected crystal is met.
- (7) Includes start-up counter of 1024 clock cycles.
- (8) Frequencies above the MAX specification do not set the fault flag. Frequencies between the MIN and MAX specifications may set the flag. A static condition or stuck at fault condition will set the flag.
- (9) Measured with logic-level input frequency but also applies to operation with crystals.

- (4) When HFXTBYPASS is set, HFXT circuits are automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-trigger Inputs section of this datasheet. Duty cycle requirements are defined by DC_{HFXT, SW}.
- (5) Oscillation allowance is based on a safety factor of 5 for recommended crystals.
- (6) Includes start-up counter of 1024 clock cycles.
- (7) This represents all the parasitic capacitance present at the HFXIN and HFXOUT terminals, respectively, including parasitic bond and package capacitance. The effective load capacitance, C_{L,eff} can be computed as C_{IN} × C_{OUT} / (C_{IN} + C_{OUT}), where C_{IN} and C_{OUT} is the total capacitance at the HFXIN and HFXOUT terminals, respectively.
- (8) Requires external capacitors at both terminals to meet the effective load capacitance specified by crystal manufacturers. Recommended effective load capacitance values supported are 14 pF, 16 pF, and 18 pF. Maximum shunt capacitance of 7 pF. The PCB adds additional capacitance, so it must also be considered in the overall capacitance. Verify that the recommended effective load capacitance of the selected crystal is met.
- (9) Frequencies above the MAX specification do not set the fault flag. Frequencies between the MIN and MAX specifications might set the flag. A static condition or stuck at fault condition will set the flag.
- (10) Measured with logic-level input frequency but also applies to operation with crystals.

		SVSHE = 0	2.2 V, 3.0 V	0.4	0.8	ms
t _{WAKE-UP-RST}	Wake-up time from a $\overline{\text{RST}}$ pin triggered reset to active mode ⁽²⁾	2.2 V, 3.0 V		480	596	μs
t _{WAKE-UP-BOR}	Wake-up time from power-up to active mode ⁽²⁾	2.2 V, 3.0 V		0.5	1	ms

- (1) The wake-up time is measured from the edge of an external wake-up signal (for example, port interrupt or wake-up event) to the first externally observable MCLK clock edge with MCLKREQEN = 1. This time includes the activation of the FRAM during wakeup. With MCLKREQEN = 0, the externally observable MCLK clock is gated one additional cycle.
- (2) The wake-up time is measured from the edge of an external wake-up signal (for example, port interrupt or wake-up event) until the first instruction of the user program is executed.

Table 5-10 lists the typical charges used during wakeup.

Table 5-10. Typical Wake-up Charges

t _(RST)	External reset pulse duration on $\overline{\text{RST}}$ ⁽⁵⁾		2.2 V, 3.0 V	2			μs

- (1) If the port pins PJ.4/LFXIN and PJ.5/LFXOUT are used as digital I/Os, they are connected by a 4-pF capacitor and a 35-MΩ resistor in series. At frequencies of approximately 1 kHz and lower, the 4-pF capacitor can add to the pin capacitance of PJ.4/LFXIN and/or PJ.5/LFXOUT.
- (2) The input leakage current is measured with V_{SS} or V_{CC} applied to the corresponding pins, unless otherwise noted.
- (3) The input leakage of the digital port pins is measured individually. The port pin is selected for input and the pullup or pulldown resistor is disabled.
- (4) An external signal sets the interrupt flag every time the minimum interrupt pulse duration t_(int) is met. It might be set by trigger signals shorter than t_(int).
- (5) Not applicable if $\overline{\text{RST}}$ /NMI pin configured as NMI

- The temperature sensor offset can be as much as $\pm 30^\circ\text{C}$. TI recommends a single-point calibration to minimize the offset error of the built-in temperature sensor.
- The device descriptor structure contains calibration values for $30^\circ\text{C} \pm 3^\circ\text{C}$ and $85^\circ\text{C} \pm 3^\circ\text{C}$ for each of the available reference voltage levels. The sensor voltage can be computed as $V_{SENSE} = TC_{SENSOR} \times (\text{Temperature}, ^\circ\text{C}) + V_{SENSOR}$, where TC_{SENSOR} and V_{SENSOR} can be computed from the calibration values for higher accuracy.
- The typical equivalent impedance of the sensor is 250 k Ω . The sample time required includes the sensor on-time, $t_{SENSOR(on)}$.
- The on-time $t_{V1/2(on)}$ is included in the sampling time $t_{V1/2(sample)}$; no additional on time is needed.

- (1) The external reference is used during ADC conversion to charge and discharge the capacitance array. The input capacitance (C_i) is also the dynamic load for an external reference during conversion. The dynamic impedance of the reference supply should follow the recommendations on analog-source impedance to allow the charge to settle for 12-bit accuracy.
- (2) Connect two decoupling capacitors, 10 µF and 470 nF, from VeREF+ or VeREF- to AVSS to decouple the dynamic current required for an external reference source if it is used for the ADC12_B. Also see the [MSP430FR58xx](#), [MSP430FR59xx](#), and [MSP430FR6xx Family User's Guide](#).

(1) Internal reference noise affects ADC performance when ADC uses the internal reference. See [Designing With the MSP430FR59xx and MSP430FR58xx ADC](#) for details on optimizing ADC performance for your application with the choice of internal or external reference.

(2) Buffer offset affects ADC gain error and thus total unadjusted error.

(3) Buffer offset affects ADC gain error and thus total unadjusted error.

(4) The internal reference current is supplied through the AVCC terminal.

(5) Calculated using the box method: (MAX(-40°C to 85°C) – MIN(-40°C to 85°C)) / MIN(-40°C to 85°C)/(85°C – (-40°C)).

(6) The condition is that the error in a conversion started after t_{REFON} is less than ±0.5 LSB.

(1) Tools that access the Spy-Bi-Wire and the BSL interfaces must wait for the $t_{SBW,En}$ time after the first transition of the TEST/SBW TCK pin (low to high), before the second transition of the pin (high to low) during the entry sequence.

(2) f_{TCK} may be restricted to meet the timing requirements of the module selected.

6 Detailed Description

6.1 Overview

The TI MSP430FR60xx(1) family of ultra-low-power microcontrollers consists of several devices featuring different sets of peripherals. The architecture, combined with seven low-power modes, is optimized to achieve extended battery life for example in portable measurement applications. The devices features a powerful 16-bit RISC CPU, 16-bit registers, and constant generators that contribute to maximum code efficiency.

The device is an MSP430FR6xx family device with Ultrasonic Sensing Solution (USS), Low-Energy Accelerator (LEA), up to six 16-bit timers, up to six eUSCs that support UART, SPI, and I²C, a comparator, a hardware multiplier, an AES accelerator, a 6-channel DMA, an RTC module with alarm capabilities, up to 76 I/O pins, and a high-performance 12-bit ADC. The MSP430FR60xx(1) devices also include an LCD module with contrast control for displays with up to 264 segments.

6.2 CPU

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock.

Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator, respectively. The remaining registers are general-purpose registers.

Peripherals are connected to the CPU using data, address, and control buses. The peripherals can be managed with all instructions.

The instruction set consists of the original 51 instructions with three formats and seven address modes and additional instructions for the expanded address range. Each instruction can operate on word and byte data.

6.3 Ultrasonic Sensing Solution (USS) Module

The USS module provides a high-precision ultrasonic sensing solution. The USS module is a sophisticated system that consists of six submodules:

- UUPS (universal USS power supply)
- HSPLL (high-speed PLL) with oscillator
- ASQ (acquisition sequencer)
- PHY (physical interface)
- PPG (programmable pulse generator) with low-output-impedance driver
- PGA (programmable gain amplifier)
- SDHS (sigma-delta high-speed ADC) with DTC (data transfer controller)

The submodules have different roles, and together they enable high-precision data acquisition in ultrasonic applications. See the dedicated chapter for each submodule in the [MSP430FR58xx](#), [MSP430FR59xx](#), and [MSP430FR6xx Family User's Guide](#).

The USS module performs complete measurement sequence without CPU involvement to achieve ultra-low power consumption for ultrasonic metrology. [图 6-1](#) shows the USS subsystem block diagram. The USS module has dedicated I/O pins without secondary functions. See the *Ultrasonic Sensing Solution (USS)* chapter in the [MSP430FR58xx](#), [MSP430FR59xx](#), and [MSP430FR6xx Family User's Guide](#) for details.

6.4 Low-Energy Accelerator (LEA) for Signal Processing

The LEA is a hardware engine designed for operations that involve vector-based signal processing, such as FIR, IIR, and FFT. The LEA offers fast performance and low energy consumption when performing vector-based digital signal processing computations. For performance benchmarks comparing LEA to using the CPU or other processors, see [Benchmarking the Signal Processing Capabilities of the Low-Energy Accelerator](#).

The LEA requires MCLK to be operational; therefore, LEA operates only in active mode or LPM0. While the LEA is running, the LEA data operations are performed on a shared 4KB of RAM out of the 8KB of total RAM (see [表 6-47](#)). This shared RAM can also be used by the regular application. The MSP CPU and the LEA can run simultaneously and independently unless they access the same system RAM.

Direct access to LEA registers is not supported, and TI offers the optimized [Digital Signal Processing \(DSP\) Library for MSP Microcontrollers](#) for the operations that the LEA module supports.

6.5 Operating Modes

The MCU has one active mode and seven software-selectable low-power modes of operation. An interrupt event can wake up the device from low-power modes LPM0 to LPM4, service the request, and return to the low-power mode on return from the interrupt program. Low-power modes LPM3.5 and LPM4.5 disable the core supply to minimize power consumption. 表 6-1 lists the operating modes and the clocks and peripherals that are available in each.

表 6-1. Operating Modes

(1) FRAM is disabled in the FRAM controller (FRCTL_A).

(2) Disabling the FRAM through the FRAM controller (FRCTL_A) allows the application to lower the LPM current consumption but the wake-up time increases when FRAM is accessed (for example, to fetch an interrupt vector). For a wakeup that does not involve FRAM (for example, a DMA transfer to RAM) the wake-up time is not increased.

(3) All clocks disabled

(4) Only while the LEA is performing a task enabled by the CPU during AM. The LEA cannot be enabled in LPM0.

(5) See 节 6.5.2, which describes the use of peripherals in LPM3 and LPM4.

(6) *Unlocked peripherals* are peripherals that do not require a clock source to operate; for example, the comparator and REF, or the eUSCI when operated as an SPI slave.

(7) Controlled by SMCLKOFF.

6.5.1 Peripherals in Low-Power Modes

Peripherals can be in different states that affect the achievable power modes of the device. The states depend on the operational modes of the peripherals (see 表 6-2). The states are:

- A peripheral is in a "high-frequency state" if it requires or uses a clock with a "high" frequency of more than 50 kHz.
- A peripheral is in a "low-frequency state" if it requires or uses a clock with a "low" frequency of 50 kHz or less.
- A peripheral is in an "unlocked state" if it does not require or use an internal clock.

If the CPU requests a power mode that does not support the current state of all active peripherals, the device does not enter the requested power mode, but it does enter a power mode that still supports the current state of the peripherals, except if an external clock is used. If an external clock is used, the application must use the correct frequency range for the requested power mode.

表 6-2. Peripheral States

(1) Peripherals are in a state that requires or uses a clock with a "high" frequency of more than 50 kHz

(2) Peripherals are in a state that requires or uses a clock with a "low" frequency of 50 kHz or less.

(3) Peripherals are in a state that does not require or does not use an internal clock.

(4) The DMA always transfers data in active mode but can wait for a trigger in any low-power mode. A DMA trigger during a low-power mode causes a temporary transition into active mode for the time of the transfer.

(5) This peripheral operates during active mode only and will delay the transition into a low-power mode until its operation is completed.

6.5.2 Idle Currents of Peripherals in LPM3 and LPM4

Most peripherals can be operational in LPM3 if clocked by ACLK. Some modules are operational in LPM4, because they do not require a clock to operate (for example, the comparator). Activating a peripheral in LPM3 or LPM4 increases the current consumption due to its active supply current contribution but also due to an additional idle current. To reduce the idle current adder, certain peripherals are grouped together. To achieve optimal current consumption, use modules within one group and limit the number of groups with active modules. 表 6-3 lists the peripheral groups. Modules not listed in this table are either already included in the standard LPM3 current consumption or cannot be used in LPM3 or LPM4.

The idle current adder is very small at room temperature (25°C) but increases at high temperatures (85°C); see the I_{IDLE} current parameters in for details.

6.6 Interrupt Vector Table and Signatures

The interrupt vectors, the power-up start address, and signatures are in the address range 0FFFFh to 0FF80h. 图 6-2 summarizes the content of this address range.

图 6-2. Interrupt Vectors, Signatures and Passwords

The power-up start address or reset vector is at 0FFFFh to 0FFFEh. It contains the 16-bit address pointing to the start address of the application program.

The interrupt vectors start at 0FFFDh and extend to lower addresses. Each vector contains the 16-bit address of the appropriate interrupt-handler instruction sequence. 表 6-4 shows the device-specific interrupt vector locations.

The vectors programmed into the address range from 0FFFFh to 0FFE0h are used as BSL password (if enabled by the corresponding signature).

The signatures start at 0FF80h and extend to higher addresses. Signatures are evaluated during device start-up. 表 6-5 shows the device-specific signature locations.

A JTAG password can be programmed starting from address 0FF88h and extending to higher addresses. The password can extend into the interrupt vector locations using the interrupt vector addresses as additional bits for the password. The length of the JTAG password depends on the JTAG signature.

See the chapter *System Resets, Interrupts, and Operating Modes, System Control Module (SYS)* in the *MSP430FR58xx, MSP430FR59xx, and MSP430FR6xx Family User's Guide* for details.

6.7 Bootloader (BSL)

The BSL can program the FRAM or RAM using a UART serial interface (FRxxxx devices) or an I²C interface (FRxxx1 devices). Access to the device memory through the BSL is protected by a user-defined password. 表 6-6 lists the pins that are required for use of the BSL. BSL entry requires a specific entry sequence on the $\overline{\text{RST}}/\text{NMI}/\text{SBWTDIO}$ and $\text{TEST}/\text{SBWTCK}$ pins. For a complete description of the features of the BSL and its implementation, see the [MSP430 FRAM Device Bootloader \(BSL\) User's Guide](#). More information on the BSL can be found at www.ti.com/tool/mspbsl.

6.8 JTAG Operation

6.8.1 JTAG Standard Interface

The MSP family supports the standard JTAG interface, which requires four signals for sending and receiving data. The JTAG signals are shared with general-purpose I/O. The TEST/SBWTCK pin is used to enable the JTAG signals. In addition to these signals, the $\overline{\text{RST}}$ /NMI/SBWDIO is required to interface with MSP development tools and device programmers. 表 6-7 lists the JTAG pin requirements. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#). For a complete description of the features of the JTAG interface and its implementation, see [MSP430 Programming With the JTAG Interface](#).

6.8.2 Spy-Bi-Wire (SBW) Interface

In addition to the standard JTAG interface, the MSP family supports the 2-wire SBW interface. SBW can be used to interface with MSP development tools and device programmers. 表 6-8 lists the SBW interface pin requirements. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#). For a complete description of the features of the JTAG interface and its implementation, see [MSP430 Programming With the JTAG Interface](#).

6.9 FRAM Controller A (FRCTL_A)

The FRAM can be programmed through the JTAG port, SBW, the BSL, or in-system by the CPU. Features of the FRAM include:

- Ultra-low-power ultra-fast-write nonvolatile memory
- Byte and word access capability
- Programmable wait state generation
- Error correction coding (ECC)

注

Wait States

For MCLK frequencies > 8 MHz, wait states must be configured following the flow described in the "Wait State Control" section of the *FRAM Controller A (FRCTL_A)* chapter in the [MSP430FR58xx, MSP430FR59xx, and MSP430FR6xx Family User's Guide](#).

For important software design information regarding FRAM including but not limited to partitioning the memory layout according to application-specific code, constant, and data space requirements, the use of FRAM to optimize application energy consumption, and the use of the Memory Protection Unit (MPU) to maximize application robustness by protecting the program code against unintended write accesses, see [MSP430™ FRAM Technology – How To and Best Practices](#).

6.10 RAM

The RAM is made up of three sectors: Sector 0 = 2KB, Sector 1 = 2KB, Sector 2 = 4KB (shared with LEA). Each sector can be individually powered down in LPM3 and LPM4 to save leakage. All data in the sector is lost when a sector is powered down.

6.11 Tiny RAM

Tiny RAM is 22 bytes of RAM in addition to the complete RAM (see [表 6-47](#)). This memory is always available, even in LPM3 and LPM4, while the complete RAM can be powered down in LPM3 and LPM4. Tiny RAM can be used to hold data or a very small stack when the complete RAM is powered down in LPM3 and LPM4. No memory is available in LPMx.5.

6.12 Memory Protection Unit (MPU) Including IP Encapsulation

The FRAM can be protected by the MPU from inadvertent CPU execution, read access, or write access. Features of the MPU include:

- IP encapsulation with programmable boundaries in steps of 1KB (prevents reads from outside the application; for example, through JTAG or by non-IP software).
- Main memory partitioning is programmable up to three segments in steps of 1KB.
- Access rights of each segment can be individually selected (main and information memory).
- Access violation flags with interrupt capability for easy servicing of access violations.

6.13 Peripherals

Peripherals are connected to the CPU through data, address, and control buses. Peripherals can be controlled using all instructions. For complete module descriptions, see the [MSP430FR58xx](#), [MSP430FR59xx](#), and [MSP430FR6xx Family User's Guide](#).

6.13.1 Digital I/O

Up to ten 8-bit I/O ports are implemented:

- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt conditions is possible.
- Programmable pullup or pulldown on all ports.
- Edge-selectable interrupt and LPM3.5 and LPM4.5 wake-up input is available for all pins of ports P1 to P9.
- Read and write access to port control registers is supported by all instructions.
- Ports P1 and P2 (PA), P3 and P4 (PB), P5 and P6 (PC), P7 and P8 (PD), or P9 (PE) can be accessed byte-wise or word-wise in pairs.
- No cross currents during start-up.

注

Configuration of Digital I/Os After BOR Reset

To prevent any cross currents during start-up of the device, all port pins are high-impedance with Schmitt triggers and their module functions disabled. To enable the I/O functionality after a BOR reset, the ports must be configured first and then the LOCKLPM5 bit must be cleared. For details, see the *Configuration After Reset* section of the *Digital I/O* chapter in the [MSP430FR58xx](#), [MSP430FR59xx](#), and [MSP430FR6xx Family User's Guide](#).

6.13.2 Oscillator and Clock System (CS)

The clock system includes support for a 32-kHz watch-crystal oscillator XT1 (LF), an internal very-low-power low-frequency oscillator (VLO), an integrated internal digitally controlled oscillator (DCO), and a high-frequency crystal oscillator XT2 (HF). The clock system module is designed to meet the requirements of both low system cost and low power consumption. A fail-safe mechanism exists for all crystal sources. The clock system module provides the following clock signals:

- Auxiliary clock (ACLK). ACLK can be sourced from a 32-kHz watch crystal (LFXT1), the internal VLO, or a digital external low-frequency (<50-kHz) clock source.
- Main clock (MCLK), the system clock used by the CPU. MCLK can be sourced from a high-frequency crystal (HFXT2), the internal DCO, a 32-kHz watch crystal (LFXT1), the internal VLO, or a digital external clock source.
- Sub-Main clock (SMCLK), the subsystem clock used by the peripheral modules. SMCLK can be sourced by same sources made available to MCLK.

6.13.3 Power-Management Module (PMM)

The PMM includes an integrated voltage regulator that supplies the core voltage to the device. The PMM also includes supply voltage supervisor (SVS) and brownout protection. The brownout circuit provides the proper internal reset signal to the device during power on and power off. The SVS circuitry detects if the supply voltage drops below a safe level and below a user-selectable level. SVS circuitry is available on the primary and core supplies.

6.13.4 Hardware Multiplier (MPY)

The multiplication operation is supported by a dedicated peripheral module. The module performs operations with 32-, 24-, 16-, and 8-bit operands. The module supports signed multiplication, unsigned multiplication, signed multiply-and-accumulate, and unsigned multiply-and-accumulate operations.

6.13.5 Real-Time Clock (RTC_C)

The RTC_C module contains an integrated real-time clock (RTC) with the following features:

- Calendar mode with leap year correction
- General-purpose counter mode

The internal calendar compensates for months with fewer than 31 days and includes leap year correction. The RTC_C also supports flexible alarm functions and offset-calibration hardware. RTC operation is available in LPM3.5 modes to minimize power consumption.

6.13.6 Measurement Test Interface (MTIF)

The MTIF module provides a simple pulse-based test interface that is used to implement consumption monitoring of "legal relevant data" with high integrity. MTIF consists of the a pulse generator, a pulse counter, and a pulse interface. MTIF has following features:

- Independent passwords for generator counter and pulse interface
- Pulse rates up to 1016 pulses per second (p/s)
- Pulse frame duration from 1/16 s to 16 s
- Count capacity up to 65535 (16 bit)
- Operating in LPM3.5 with 200 nA
- 2-pin interface with MTIF_OUT_IN and MTIF_PIN_EN

6.13.7 Watchdog Timer (WDT_A)

The primary function of the WDT_A module is to perform a controlled system restart if a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be configured as an interval timer and can generate interrupts at selected time intervals. 表 6-9 lists the clocks that can source the WDT_A module.

表 6-9. WDT_A Clocks

6.13.8 System Module (SYS)

The SYS module manages many system functions within the device. These functions include power-on reset (POR) and power-up clear (PUC) handling, NMI source selection and management, reset interrupt vector generators, bootloader (BSL) entry mechanisms, and configuration management (device descriptors). The SYS module also includes a data exchange mechanism through JTAG called a JTAG mailbox that can be used in the application. 表 6-10 lists the SYS module interrupt vector registers.

6.13.9 DMA Controller

The DMA controller allows movement of data from one memory address to another without CPU intervention. For example, the DMA controller can be used to move data from the ADC12_B conversion memory to RAM. Using the DMA controller can increase the throughput of peripheral modules. The DMA controller reduces system power consumption by allowing the CPU to remain in sleep mode, without having to awaken to move data to or from a peripheral. 表 6-11 lists the available triggers for the DMA.

6.13.10 Enhanced Universal Serial Communication Interface (eUSCI)

The eUSCI modules are used for serial data communication. The eUSCI module supports synchronous communication protocols such as SPI (3- or 4-pin) and I²C, and asynchronous communication protocols such as UART, enhanced UART with automatic baud-rate detection, and IrDA.

The eUSCI_A0, eUSCI_A1, eUSCI_A2, and eUSCI_A3 modules support SPI (3- or 4-pin), UART, enhanced UART, and IrDA.

The eUSCI_B0 and eUSCI_B1 modules support SPI (3- or 4-pin) and I²C.

Four eUSCI_A modules and two eUSCI_B modules are implemented.

6.13.11 TA0, TA1, and TA4

TA0, TA1, and TA4 are 16-bit timers and counters (Timer_A type) with three (TA0 and TA1) or two (TA4) capture/compare registers each. Each timer can support multiple captures or compares, PWM outputs, and interval timing (see 表 6-12, 表 6-13, and 表 6-14). Each timer has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each capture/compare register.

6.13.13 TB0

TB0 is a 16-bit timer and counter (Timer_B type) with seven capture/compare registers. TB0 can support multiple captures or compares, PWM outputs, and interval timing (see 表 6-17). TB0 has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each capture/compare register.

6.13.14 ADC12_B

The ADC12_B module supports fast 12-bit analog-to-digital conversions with differential and single-ended inputs. The module implements a 12-bit SAR core, sample select control, a reference generator, and a conversion result buffer. A window comparator with lower and upper limits allows CPU-independent result monitoring with three window comparator interrupt flags.

6.13.16 Comparator_E

The primary function of the Comparator_E module is to support precision slope analog-to-digital conversions, battery voltage supervision, and monitoring of external analog signals.

6.13.17 CRC16

The CRC16 module produces a signature based on a sequence of entered data values and can be used for data checking purposes. The CRC16 module signature is based on the CRC-CCITT standard.

6.13.18 CRC32

The CRC32 module produces a signature based on a sequence of entered data values and can be used for data checking purposes. The CRC32 module signature is based on the ISO 3309 standard.

6.13.19 AES256 Accelerator

The AES accelerator module performs encryption and decryption of 128-bit data with 128-, 192-, or 256-bit keys according to the Advanced Encryption Standard (AES) (FIPS PUB 197) in hardware.

6.13.20 True Random Seed

The device descriptor information (TLV) section contains a 128-bit true random seed that can be used to implement a deterministic random number generator.

6.13.21 Shared Reference (REF)

The REF module generates critical reference voltages that can be used by the various analog peripherals in the device.

6.13.22 LCD_C

The LCD_C driver generates the segment and common signals required to drive a liquid crystal display (LCD). The LCD_C controller has dedicated data memories to hold segment drive information. Common and segment signals are generated as defined by the mode. Static and 2-mux to 8-mux LCDs are supported. The module can provide an LCD voltage independent of the supply voltage with its integrated charge pump. It is possible to control the level of the LCD voltage and thus contrast by software. The module also provides an automatic blinking capability for individual segments in static, 2-, 3-, and 4-mux modes.

To reduce system noise, the charge pump can be temporarily disabled. [表 6-23](#) lists the available automatic charge pump disable options.

表 6-23. LCD Automatic Charge Pump Disable Bits (LCDCPDISx)

CONTROL BIT	DESCRIPTION
LDCPDIS0	LCD charge pump disable during ADC12 conversion 0b = LCD charge pump not automatically disabled during conversion. 1b = LCD charge pump automatically disabled during conversion.
LDCPDIS1 to LDCPDIS7	No functionality.

6.13.23 Embedded Emulation

6.13.23.1 Embedded Emulation Module (EEM) (S Version)

The EEM supports real-time in-system debugging. The S version of the EEM has the following features:

- Three hardware triggers or breakpoints on memory access
- One hardware trigger or breakpoint on CPU register write access
- Up to four hardware triggers that can be combined to form complex triggers or breakpoints
- One cycle counter
- Clock control on module level

6.13.23.2 EnergyTrace++ Technology

The devices implement circuitry to support EnergyTrace++ technology. The EnergyTrace++ technology lets the user observe information about the internal states of the microcontroller. These states include the CPU Program Counter (PC), the on or off status of the peripherals and system clocks (regardless of the clock source), and the low-power mode currently in use. These states can always be read by a debug tool, even when the microcontroller sleeps in LPMx.5 modes.

The activity of the following modules can be observed:

- LEA is running
- MPY is calculating.
- WDT is counting.
- RTC is counting.
- ADC: a sequence, sample, or conversion is active.
- REF: REFBG or REFGEN active and BG in static mode.

- COMP is on.
- AES is encrypting or decrypting.
- eUSCI_A0 is transferring (receiving or transmitting) data.
- eUSCI_A1 is transferring (receiving or transmitting) data.
- eUSCI_A2 is transferring (receiving or transmitting) data.
- eUSCI_A3 is transferring (receiving or transmitting) data.
- eUSCI_B0 is transferring (receiving or transmitting) data.
- eUSCI_B1 is transferring (receiving or transmitting) data.
- TB0 is counting.
- TA0 is counting.
- TA1 is counting.
- TA2 is counting.
- TA3 is counting.
- TA4 is counting.
- LCD_C is running.
- USS status

6.14.1 Port Function Select Registers (PySEL1 , PySEL0)

Port pins are multiplexed with peripheral module functions as described in the [MSP430FR58xx, MSP430FR59xx, and MSP430FR6xx Family User's Guide](#). The functions of each port pin are controlled by its port function select registers, PySEL1 and PySEL0, where y = port number. The bits in the registers are mapped to the pins in the port. The primary module function, secondary module function, and tertiary module function of the pins are determined by the configuration of the PySEL1.x and PySEL0.x bits (see [表 6-24](#)). For example, P1SEL1.0 and P1SEL0.0 determine the primary module function, secondary module function, and tertiary module function of the P1.0 pin, which is in port 1. The module functions may also require the PxDIR bits to be configured according to the direction needed for the module function.

Secondary module function is selected	1	0

See the port pin function tables in the following sections for the configurations of the function and direction for each pin.

(1) X = Don't care

(2) Default condition

(3) The pin direction is controlled by the JTAG module. JTAG mode selection is made through the SYS module or by the Spy-Bi-Wire four-wire entry sequence. Neither PJSEL1.x and PJSEL0.x nor CEPDx bits have an effect in these cases.

(4) Setting the CEPDx bit of the comparator disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. Selecting the Cx input pin to the comparator multiplexer with the input select bits in the comparator module automatically disables the output driver and input buffer for that pin, regardless of the state of the associated CEPDx bit.

(5) In JTAG mode, pullups are activated automatically on TMS, TCK, and TDI/TCLK. PJREN.x are don't care.

When HFXTBYPASS = 0, PJ.6 and PJ.7 are configured for crystal operation and PJSEL1.6 and PJSEL0.7 are do not care. When HFXTBYPASS = 1, PJ.6 is configured for bypass operation and PJ.7 is configured as general-purpose I/O.

(3) With PJSEL0.7 = 1 or PJSEL1.7 = 1 the general-purpose I/O functionality is disabled. No input function is available. Configured as output the pin is actively pulled to zero.

(4) When PJ.6 is configured in bypass mode, PJ.7 is configured as general-purpose I/O.

(2) ADC gain: The gain correction factor is measured at room temperature using a 2.5-V external voltage reference without internal buffer (ADC12VRSEL = 0x2, 0x4, or 0xE). Other settings (for example, using internal reference) can result in different correction factors.

(3) ADC offset: the offset correction factor is measured at room temperature using ADC12VRSEL = 0x2 or 0x4, an external reference, V_{R+} = external 2.5 V, V_{R-} = AVSS.

6.17 Identification

6.17.1 Revision Identification

The device revision information is shown as part of the top-side marking on the device package. The device-specific errata sheet describes these markings. For links to the errata sheets for the devices in this data sheet, see [节 8.4](#).

The hardware revision is also stored in the Device Descriptor structure in the Info Block section. For details on this value, see the "Hardware Revision" entries in the Device Descriptor structure (see [节 6.15](#)).

6.17.2 Device Identification

The device type can be identified from the top-side marking on the device package. The device-specific errata sheet describes these markings. For links to the errata sheets for the devices in this data sheet, see [节 8.4](#).

A device identification value is also stored in the Device Descriptor structure in the Info Block section. For details on this value, see the "Device ID" entries in the Device Descriptor structure.

6.17.3 JTAG Identification

Programming through the JTAG interface, including reading and identifying the JTAG ID, is described in [MSP430 Programming With the JTAG Interface](#).

7 Applications, Implementation, and Layout

注

Information in the following Applications section is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

7.1 Device Connection and Layout Fundamentals

This section describes the recommended guidelines when designing with the MSP MCU. These guidelines are to make sure that the device has proper connections for powering, programming, debugging, and optimum analog performance.

7.1.1 Power Supply Decoupling and Bulk Capacitors

TI recommends connecting a combination of a 1- μF plus a 100-nF low-ESR ceramic decoupling capacitor to each AVCC and DVCC pin (see 图 7-1). Higher-value capacitors may be used but can affect supply rail ramp-up time. Decoupling capacitors must be placed as close as possible to the pins that they decouple (within a few millimeters). Additionally, TI recommends separated grounds with a single-point connection for better noise isolation from digital to analog circuits on the board and to achieve high analog accuracy.

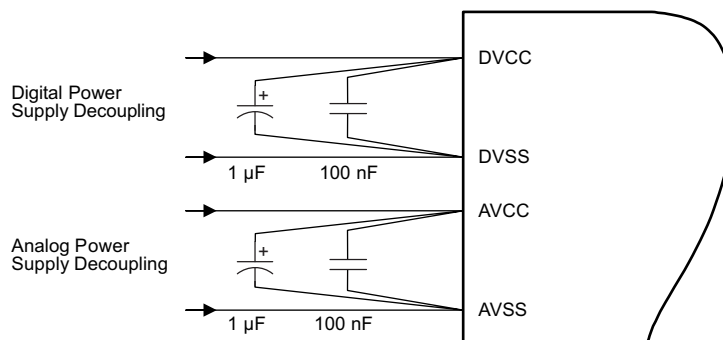

图 7-1. Power Supply Decoupling

For PVCC and PVSS, TI recommends connecting a combination of a 1- μF plus a 22- μF low-ESR ceramic decoupling capacitor between the PVCC and PVSS pins and a serial 22- Ω resistor to filter low-frequency noise on the supply line (see 图 7-2).

图 7-2. Power Supply Decoupling for PVCC and PVSS

7.1.2 External Oscillator (HFXT and LFXT)

Depending on the device variant (see 节 3), the device can support a low-frequency crystal (32 kHz) on the LFXT pins, a high-frequency crystal on the HFXT pins, or both. External bypass capacitors for the crystal oscillator pins are required.

It is also possible to apply digital clock signals to the LFXIN and HFXIN input pins that meet the specifications of the respective oscillator if the appropriate LFXTBYPASS or HFXTBYPASS mode is selected. In this case, the associated LFXOUT and HFXOUT pins can be used for other purposes. If they are left unused, they must be terminated according to 节 4.6.

图 7-3 shows a typical connection diagram.

图 7-3. Typical Crystal Connection

See [MSP430 32-kHz Crystal Oscillators](#) for more information on selecting, testing, and designing a crystal oscillator with the MSP MCUs.

7.1.3 USS Oscillator (USSXT)

Depending on the device variant (see 节 3), the device with USS module supports a high-frequency crystal on the USSXT pins. External bypass capacitors for the crystal oscillator pins are required. Serially connect a 22-Ω resistor close to the USSXTOUT pin (see 图 7-4). The USSXT does not support bypass mode, so it is not possible to apply digital clock signals to the USSXTIN pin. Never connect the USSXTIN pin to a power supply line (AVCC, DVCC, or PVCC). If the USSXT pins are not used, terminate them according to 节 4.6.

图 7-4 shows a typical connection diagram.

图 7-4. Typical Crystal Connection

Consider the following items for the USSXT layout:

- Keep the trace of USSXTIN and USSXTOUT as short as possible. If one must be longer than the other, keep USSXTIN shorter, because USSXTIN is more sensitive to EMI.
- Make the ground shield open ended without making a loop.
- Use a ground plane to reduce the impedance of the ground trace.
- If USSXT_BOUT is used, keep coupling to USSXTIN and CH0_IN to a minimum.
- If USSXT_BOUT is feeding other clock or device inputs, apply a small capacitor (10 pF) as the line termination load at the end of the line. This avoids reflection artifacts on sensitive inputs (for example, HFXTIN).

图 7-5 shows the recommended PCB layout.

图 7-5. USSXT PCB Layout Recommendation

7.1.4 Transducer Connection to the USS Module

图 7-6 shows a typical connection of two transducers to the USS output and input pins. TI recommends 1% error tolerance for the external termination resistors (R_{term0} and R_{term1}) and the AC coupling capacitors (C_{ac0} and C_{ac1}). Typical value of the termination resistors is in the range of 150 to 400 Ω , the AC coupling capacitors are 1 to 2 nF. Actual values should be determined to meet the requirements of each application.

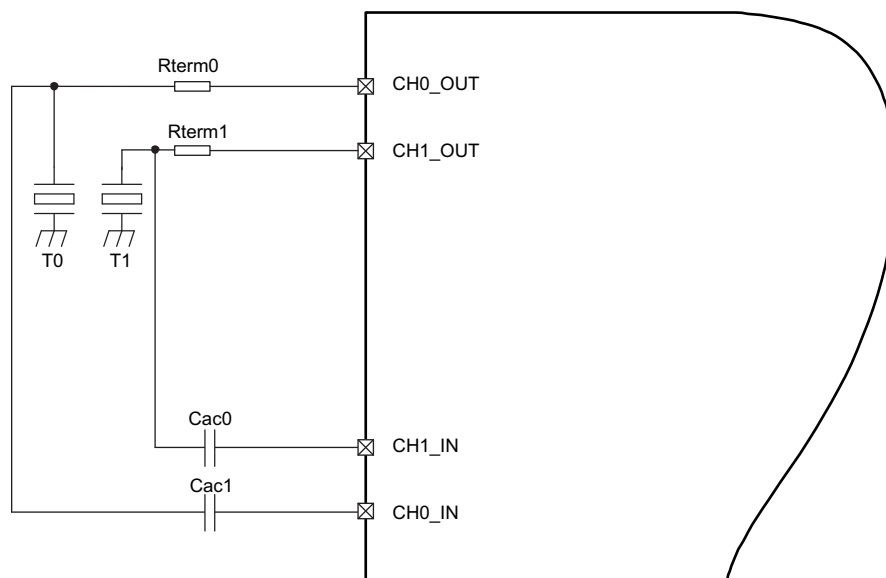

图 7-6. Typical Transducer Connection

7.1.5 Charge Pump Control of Input Multiplexer

图 7-7 shows the control logic of the charge pump control of the input multiplexer of CHx_IN . The charge pump is enabled as long the $SAPH_AMCNF.CPEO$ is high and during the arming of the SDHS. Use the CPDA bit to control the CP during data acquisition.

图 7-7. Control Of Input Multiplexer

7.1.6 JTAG

With the proper connections, the debugger and a hardware JTAG interface (such as the MSP-FET or MSP-FET430UIF) can be used to program and debug code on the target board. In addition, the connections also support the MSP-GANG production programmers, thus providing an easy way to program prototype boards, if desired. 图 7-8 shows the connections between the 14-pin JTAG connector and the target device required to support in-system programming and debugging for 4-wire JTAG communication. 图 7-9 shows the connections for 2-wire JTAG mode (Spy-Bi-Wire).

The connections for the MSP-FET and MSP-FET430UIF interface modules and the MSP-GANG are identical. Both can supply V_{CC} to the target board (through pin 2). In addition, the MSP-FET and MSP-FET430UIF interface modules and MSP-GANG have a V_{CC} sense feature that, if used, requires an alternate connection (pin 4 instead of pin 2). The V_{CC} sense feature senses the local V_{CC} present on the target board (that is, a battery or other local power supply) and adjusts the output signals accordingly. 图 7-8 and 图 7-9 show a jumper block that supports both scenarios of supplying V_{CC} to the target board. If this flexibility is not required, the desired V_{CC} connections may be hard-wired to eliminate the jumper block. Pins 2 and 4 must not be connected at the same time.

For additional design information regarding the JTAG interface, see the [MSP430 Hardware Tools User's Guide](#).

- Make connection J1 if a local target power supply is used, or make connection J2 if the target is powered from the debug or programming adapter.
- The device $\overline{\text{RST/NMI/SBWDIO}}$ pin is used in 2-wire mode for bidirectional communication with the device during JTAG access, and any capacitance that is attached to this signal may affect the ability to establish a connection with the device. The upper limit for C1 is 2.2 nF when using current TI tools.

图 7-9. Signal Connections for 2-Wire JTAG Communication (Spy-Bi-Wire)

7.1.7 Reset

The reset pin can be configured as a reset function (default) or as an NMI function in the SFRRPCR register.

In reset mode, the $\overline{\text{RST/NMI}}$ pin is active low, and a pulse applied to this pin that meets the reset timing specifications generates a BOR-type device reset.

Setting SYSNMI causes the $\overline{\text{RST/NMI}}$ pin to be configured as an external NMI source. The external NMI is edge sensitive, and its edge is selectable by SYSNMIIES. Setting the NMIIE enables the interrupt of the external NMI. When an external NMI event occurs, the NMIIFG is set.

The $\overline{\text{RST/NMI}}$ pin can have either a pullup or pulldown that is enabled or not. SYSRSTUP selects either pullup or pulldown, and SYSRSTRE causes the pullup (default) or pulldown to be enabled (default) or not. If the $\overline{\text{RST/NMI}}$ pin is unused, it is required either to select and enable the internal pullup or to connect an external 47-kΩ pullup resistor to the $\overline{\text{RST/NMI}}$ pin with a 2.2-nF pulldown capacitor. The pulldown capacitor should not exceed 2.2 nF when using devices with Spy-Bi-Wire interface in Spy-Bi-Wire mode or in 4-wire JTAG mode with TI tools like FET interfaces or GANG programmers.

See the [MSP430FR58xx](#), [MSP430FR59xx](#), and [MSP430FR6xx Family User's Guide](#) for more information on the referenced control registers and bits.

7.1.8 Unused Pins

For details on the connection of unused pins, see 节 4.6.

7.1.9 General Layout Recommendations

- Proper grounding and short traces for external crystal to reduce parasitic capacitance. See [MSP430 32-kHz Crystal Oscillators](#) for recommended layout guidelines.
- Proper bypass capacitors on DVCC, AVCC, and reference pins if used.
- Avoid routing any high-frequency signal close to an analog signal line. For example, keep digital switching signals such as PWM or JTAG signals away from the oscillator circuit.
- Proper ESD level protection should be considered to protect the device from unintended high-voltage electrostatic discharge. See [MSP430 System-Level ESD Considerations](#) for guidelines.

7.1.10 Do's and Don'ts

TI recommends powering AVCC and DVCC pins from the same source. At a minimum, during power up, power down, and device operation, the voltage difference between AVCC and DVCC must not exceed the limits specified in [Section 5.1](#). Exceeding the specified limits may cause malfunction of the device including erroneous writes to RAM and FRAM.

7.2 Peripheral- and Interface-Specific Design Information

7.2.1 ADC12_B Peripheral

7.2.1.1 Partial Schematic

图 7-10 shows the recommended connections for the reference input pins.

图 7-10. ADC12_B Grounding and Noise Considerations

7.2.1.2 Design Requirements

As with any high-resolution ADC, appropriate printed-circuit-board layout and grounding techniques should be followed to eliminate ground loops, unwanted parasitic effects, and noise.

Ground loops are formed when return current from the ADC flows through paths that are common with other analog or digital circuitry. If care is not taken, this current can generate small unwanted offset voltages that can add to or subtract from the reference or input voltages of the ADC. The general guidelines in [节 7.1.1](#) combined with the connections shown in [图 7-10](#) prevent these offsets.

In addition to grounding, ripple and noise spikes on the power-supply lines that are caused by digital switching or switching power supplies can corrupt the conversion result. A noise-free design using separate analog and digital ground planes with a single-point connection is recommended to achieve high accuracy.

图 7-10 shows the recommended decoupling circuit when an external voltage reference is used. The internal reference module has a maximum drive current as specified in the $I_{O(VREF+)}$ specification of the REF module.

The reference voltage must be a stable voltage for accurate measurements. The capacitor values that are selected in the general guidelines filter out the high- and low-frequency ripple before the reference voltage enters the device. In this case, the 10- μ F capacitor buffers the reference pin and filter any low-frequency ripple. A 470-nF bypass capacitor filters out any high-frequency noise.

7.2.1.3 Detailed Design Procedure

For additional design information, see [Designing With the MSP430FR58xx, FR59xx, FR68xx, and FR69xx ADC](#).

7.2.1.4 Layout Guidelines

Component that are shown in the partial schematic (see [图 7-10](#)) should be placed as close as possible to the respective device pins. Avoid long traces, because they add additional parasitic capacitance, inductance, and resistance on the signal.

Avoid routing analog input signals close to a high-frequency pin (for example, a high-frequency PWM), because the high-frequency switching can be coupled into the analog signal.

If differential mode is used for the ADC12_B, the analog differential input signals must be routed closely together to minimize the effect of noise on the resulting signal.

7.2.2 LCD_C Peripheral

7.2.2.1 Partial Schematic

Required LCD connections greatly vary by the type of display that is used (static or multiplexed), whether external or internal biasing is used, and whether the on-chip charge pump is employed. Also, there is a fair amount of flexibility as to how the segment (Sx) and common (COMx) signals are connected to the MCU, which can provide unique benefits. Because LCD connections are application-specific, it is difficult to provide a single one-fits-all schematic. However, for examples and how-to circuit design guidance, see [Designing With MSP430™ MCUs and Segment LCDs](#).

7.2.2.2 Design Requirements

Due to the flexibility of the LCD_C peripheral module to accommodate various segment-based LCDs, selecting the correct display for the application in combination with determining specific design requirements is often an iterative process. TI strongly recommends reviewing the LCD_C peripheral module chapter in the [MSP430FR58xx, MSP430FR59xx, and MSP430FR6xx Family User's Guide](#) and [Designing With MSP430™ MCUs and Segment LCDs](#) during the initial design requirements and decision process.

7.2.2.3 Detailed Design Procedure

A major component in designing the LCD solution is determining the exact connections between the LCD_C peripheral module and the display. Two basic design processes can be employed for this step, although in reality often a balanced co-design approach is recommended:

- PCB layout-driven design, optimizing signal routing
- Software-driven design, focusing on optimizing computational overhead

For a detailed discussion of the design procedure as well as for design information regarding the LCD controller input voltage selection including internal and external options, contrast control, and bias generation, see [Designing With MSP430™ MCUs and Segment LCDs](#) and the [LCD_C Controller](#) chapter in the [MSP430FR58xx, MSP430FR59xx, and MSP430FR6xx Family User's Guide](#).

7.2.2.4 Layout Guidelines

LCD segment (Sx) and common (COMx) signal traces are continuously switching while the LCD is enabled and should, therefore, be kept away from sensitive analog signals such as ADC inputs to prevent any noise coupling. TI recommends keeping the LCD signal traces on one side of the PCB grouped together in a bus-like fashion. A ground plane beneath the LCD traces and guard traces alongside the LCD traces can provide shielding.

If the internal charge pump of the LCD module is used, place the externally provided capacitor on the LCDCAP pin as close as possible to the MCU. Connect the capacitor to the device using a short and direct trace and also have a solid connection to the ground plane that supplies the V_{SS} pins of the MCU.

For an example layouts and a more in-depth discussion, see [Designing With MSP430™ MCUs and Segment LCDs](#).

8.2 器件命名规则

为了标示产品开发周期所处的阶段，TI 为所有 MSP MCU 器件的部件号分配了前缀。每个 MSP MCU 商用系列产品成员都具有以下两个前缀之一：MSP 或 XMS。这些前缀代表了产品开发的发展阶段，即从工程原型 (XMS) 直到完全合格的生产器件 (MSP)。

XMS - 实验器件，不一定代表最终器件的电气规格

MSP - 完全合格的生产器件

XMS 器件在供货时附带如下免责声明：

“开发中的产品用于内部评估用途。”

MSP 器件的特性已经全部明确，并且器件的质量和可靠性已经完全论证。TI 的标准保修证书对该器件适用。

预测显示原型器件 (XMS) 的故障率大于标准生产器件。由于这些器件的预计最终使用故障率尚不确定，德州仪器 (TI) 建议不要将它们用于任何生产系统。请仅使用合格的生产器件。

TI 器件的命名规则还包括一个带有器件系列名称的后缀。此后缀表示温度范围、封装类型和配送形式。[图 8-1](#) 提供了解读完整器件名称的图例。

MSP 驱动程序库 驱动程序库的抽象化 API 通过提供易于使用的函数调用使您不再拘泥于 MSP430 硬件的细节。完整的文档通过具有帮助意义的 API 指南交付，其中包括有关每个函数调用和经过验证的参数的详细信息。开发人员可以使用驱动程序库功能，以最低开销编写完整项目。

MSP EnergyTrace™ 技术 适用于 MSP430 微控制器的 EnergyTrace 技术是基于电能的代码分析工具，适用于测量和显示应用的电能系统配置并帮助优化应用以实现超低功耗。

ULP（超低功耗）Advisor ULP Advisor™ 软件是一款辅助工具，旨在指导开发人员编写更为高效的代码，从而充分利用 MSP430 和 MSP432 微控制器独特的超低功耗功能。ULP Advisor 的目标用户是微控制器的资深开发者和开发新手，可以根据详尽的 ULP 检验表检查代码，以便以最低的功耗最大限度地利用应用。在生成时，ULP Advisor 提供通知和备注，以标识代码中可以进一步优化的区域，进而实现更低的功耗。

适用于 MSP MCU 的定点数学库 MSP IQmath 和 Qmath 库是为 C 语言开发者提供的一套经过高度优化的高精度数学运算函数集合，能够将浮点算法无缝嵌入 MSP430 和 MSP432 器件的定点代码中。这些例程通常用于计算密集型实时应用，而优化的执行速度、高精度以及超低能耗通常是影响这些实时应用的关键因素。与使用浮点数学算法编写的同等代码相比，使用 IQmath 和 Qmath 库可以大幅提高执行速度并显著降低能耗。

适用于 MSP430™ MCU 的浮点数学库 TI 在低功耗和低成本微控制器领域锐意创新，为您提供 MSPMATHLIB。这是标量函数的浮点数学运算库，能够充分利用器件的智能外设，使性能提升高达 26 倍。Mathlib 能够轻松集成到您的设计中。该运算库免费使用并集成在 Code Composer Studio 和 IAR IDE 中。如需深入了解该数学运算库及相关基准，请阅读用户指南。

开发工具

适用于 MSP 微控制器的 Code Composer Studio™ 集成开发环境 Code Composer Studio 是一种集成开发环境 (IDE)，支持所有 MSP 微控制器。Code Composer Studio 包含一整套开发和调试嵌入式应用的嵌入式软件实用程序的工具。它包含了优化的 C/C++ 编译器、源代码编辑器、项目构建环境、调试器、描述器以及其他多种功能。直观的 IDE 提供了单个用户界面，有助于完成应用程序开发流程的每个步骤。熟悉的实用程序和界面可提升用户的入门速度。Code Composer Studio 将 Eclipse 软件框架的优点和 TI 先进的嵌入式调试功能相结合，为嵌入式开发人员提供了一种功能丰富的优异开发环境。当 CCS 与 MSP MCU 搭配使用时，可以使用独特而强大的插件和嵌入式软件实用程序，从而充分利用 MSP 微控制器的功能。

命令行编程器 MSP Flasher 是一款基于 shell 的开源接口，可使用 JTAG 或 Spy-Bi-Wire (SBW) 通信通过 FET 编程器或 eZ430 对 MSP 微控制器进行编程。MSP Flasher 可用于将二进制文件 (.txt 或

.hex 文件) 直接下载到 MSP 微控制器, 而无需使用 IDE。

MSP MCU 编程器和调试器 MSP-FET 是一款强大的仿真开发工具(通常称为调试探针), 可帮助用户在 MSP 低功耗微控制器(MCU)中快速开发应用。创建 MCU 软件通常需要将生成的二进制程序下载到 MSP 器件, 以进行验证和调试。MSP-FET 在主机和目标 MSP 间提供调试通信通道。此外, MSP-FET 还可在计算机的 USB 接口和 MSP UART 间提供反向通道 UART 连接。这为 MSP 编程器提供了一种在 MSP 和计算机上运行的终端之间进行串行通信的便捷方法。MSP-FET 还支持使用 BSL 通过 UART 和 I²C 通信协议向 MSP 目标加载程序(通常称为固件)。

MSP-GANG 生产编程器 MSP Gang 编程器是一款 MSP430 或 MSP432 器件编程器, 可同时对多达八个完全相同的 MSP430 或 MSP432 闪存或 FRAM 器件进行编程。MSP Gang 编程器可使用标准的 RS-232 或 USB 连接与主机 PC 相连并提供灵活的编程选项, 允许用户完全自定义流程。MSP Gang 编程器配有扩展板, 即“Gang 分离器”, 可在 MSP Gang 编程器和多个目标器件间实施互连。提供了八条电缆, 用于将扩展板与八个目标器件相连(通过 JTAG 或 SPY-Bi-Wire 连接器)。编程工作可在 PC 或独立设备上完成。PC 端具备基于 DLL 的图形化用户界面。

8.4 文档支持

以下文档对 MSP430FR604x(1)、MSP430FR603x(1)、MCU 进行了介绍。www.ti.com.cn 网站上提供了这些文档的副本。

接收文档更新通知

要接收文档更新通知(包括芯片勘误表), 请转至 ti.com.cn 上您的器件对应的产品文件夹(关于产品文件夹的链接, 请参见节 8.5)。单击右上角的“提醒我”(Alert me) 按钮。点击注册后, 即可收到产品信息更改每周摘要(如有)。有关更改的详细信息, 请查阅已修订文档的修订历史记录。

用户指南

《[MSP430FR58xx、MSP430FR59xx 和 MSP430FR6xx 系列用户指南](#)》 该器件系列提供的所有模块和外设的详细说明。

《[MSP430™ FRAM 器件引导加载程序 \(BSL\) 用户指南](#)》 MSP430 微控制器 (MCU) 上的引导加载程序 (BSL) 允许用户在原型设计、最终生产和使用期间与 MSP430 MCU 中的嵌入式存储器进行通信。可编程存储器 (FRAM 存储器) 和数据存储器 (RAM) 均可按要求予以修改。

通过 JTAG 接口进行 MSP430™ 编程 此文档介绍了使用 JTAG 通信端口擦除、编程和验证基于 MSP430 闪存和 FRAM 的微控制器系列的存储器模块所需的功能。此外，该文档还介绍了如何编程所有 MSP430 器件上均具备的 JTAG 访问安全保险丝。此文档介绍了使用标准四线制 JTAG 接口和两线制 JTAG 接口 (也称为 Spy-Bi-Wire (SBW)) 的器件访问。

《[MSP430™ 硬件工具用户指南](#)》 此手册介绍了 TI MSP-FET430 闪存仿真工具 (FET) 的硬件。FET 是针对 MSP430 超低功耗微控制器的程序开发工具。

应用报告

《[MSP430™ 32kHz 晶体振荡器](#)》 对于稳定的晶体振荡器，选择合适的晶振、正确的负载电路和适当的电路板布局布线至关重要。该应用报告总结了晶体振荡器的功能，介绍了用于选择合适的晶体以实现 MSP430 超低功耗运行的参数。此外，还给出了正确电路板布局的提示和示例。此外，为了确保振荡器在大规模生产后能够稳定运行，还可能需要进行一些振荡器测试，该文档中提供了有关这些测试的详细信息。

《[MSP430™ 系统级 ESD 注意事项](#)》 系统级 ESD 对于低电压下的硅晶技术以及经济高效型和超低功耗组件的需求日益增加。本应用报告解决了三大不同的 ESD 主题，帮助电路板设计人员和 OEM 了解并设计强大的系统级设计：(1) 组件及 ESD 测试和系统级 ESD 测试，二者的差异及组件级 ESD 标准无法保障系统级稳健性的原因。(2) 不同层级的系统级 ESD 防护常规设计指南，包括外壳、电缆、PCB 布线以及板载 ESD 保护器件。(3) 系统高效 ESD 设计 (SEED) 简介，这是一种可实现系统级 ESD 稳健性的板载和片上 ESD 防护协同设计方法，包括示例仿真和测试结果。另外还介绍了若干实际应用系统级 ESD 保护设计示例及其结果。

8.7 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

8.8 Export Control Notice

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from disclosing party under nondisclosure obligations (if any), or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorization from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

- (3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
