

SN65LVDS302 可编程 27 位串行转并行接收器

1 特性

- 串行接口技术
- 与 FlatLink™3G 兼容，例如 SN65LVDS301
- 支持在 1、2 或 3 条 SubLVDS 差分线路上接收高达 24 位 RGB 数据和 3 个控制位的视频接口
- SubLVDS 差分电压电平
- 数据吞吐量高达 1.755Gbps
- 三种节能工作模式
 - 有源模式 QVGA : 17mW
 - 典型关断 : 0.7 μW
 - 典型待机模式 : 27 μW (典型值)
- 通过总线交换功能提高 PCB 布局灵活性
- ESD 等级 > 4kV (HBM)
- 像素时钟范围为 4MHz 至 65MHz
- 所有 CMOS 输入的失效防护
- 采用 5mm × 5mm nFBGA 封装，0.5mm 焊球间距
- 极低的电磁干扰 (EMI)，符合 SAE J1752/3 'Kh' 技术规范

2 应用

- 可穿戴设备 (非医用)
- 平板电脑
- 手机
- 便携式电子产品
- 游戏
- 零售自动化和支付
- 楼宇自动化

3 说明

SN65LVDS302 接收器将与 FlatLink™3G 兼容的串行输入数据解串为 27 个并行数据输出。SN65LVDS302 接收器包含一个移位寄存器，在检查奇偶校验位之后，此寄存器从 1、2 或 3 个串行输入载入 30 位，并且将 24 个像素位和 3 个控制位锁存至并行 CMOS 输出。如果奇偶校验确认奇偶校验正确，通道奇偶校验错误 (CPE) 输出保持低电平。如果检测到奇偶校验错误，CPE 输出生成一个高脉冲，而数据输出总线忽略刚刚接收到的像素。或者，最后一个数据字在下一个时钟周期内被保持在输出总线上。

器件信息(1)

器件型号	封装	封装尺寸 (标称值)
SN65LVDS302	nFBGA (80)	5.00mm × 5.00mm

(1) 要了解所有可用封装，请见数据表末尾的可订购产品附录。

4 Revision History

注：以前版本的页码可能与当前版本的页码不同

Changes from Revision D (May 2016) to Revision E (October 2020)	Page
• 注：采用 MicroStar Jr. BGA 封装的器件采用层压 nFBGA 封装进行了重新设计。这种 nFBGA 封装提供了类似于数据表中的电气性能。该封装占用空间也类似于 MicroStar Jr. BGA。将在整个数据表中更新全新封装标识符来代替已停止使用的封装标识符。.....	1
• 将 u*jr ZQE 更改为 nFBGA ZXH.....	1
• Changed u*jr ZQE to nFBGA ZXH.....	3
• Changed u*jr ZQE to nFBGA ZXH, updated thermal information.....	7
• Correct SN65LVDS822 to SN65LVDS302.....	39

Changes from Revision C (August 2012) to Revision D (May 2016)	Page
• 添加了 ESD 等级表、特性说明部分、器件功能模式部分、应用和实现部分、电源相关建议部分、布局部分、器件和文档支持部分以及机械、封装和可订购信息部分.....	1

5 Pin Configuration and Functions

图 5-1. ZXH Package 80-Pin nFBGA Top View

表 5-1. Pin Functions

PIN			DESCRIPTION
NAME	NO.	I/O	
CMOS			
B0 to B7	See (1)	CMOS Out	Blue pixel data
G0 to G7	See (1)	CMOS Out	Green pixel data
R0 to R7	See (1)	CMOS Out	Red pixel data
CPE	J9	CMOS Out	Channel parity error This output indicates the detection of a parity error by generating an output high-pulse for half of a PCLK clock cycle; this allows counting parity errors with a simple counter. 0: no error high-pulse: bit error detected

表 5-1. Pin Functions (continued)

PIN			DESCRIPTION
NAME	NO.	I/O	
CPOL	H1	CMOS In	Output clock polarity selection: 0: rising edge clocking 1: falling edge clocking
DE	J8	CMOS Out	Data Enable
F/S	G8	CMOS In	CMOS bus rise time select: 1: fast output rise time 0: slow output rise time
HS	H9	CMOS Out	Horizontal sync
LS0	C1	CMOS In	Link select: determines active SubLVDS Data Links and PLL Range) (see 表 8-1)
LS1	D2		
PCLK	G9	CMOS Out	Output Pixel Clock; rising or falling clock polarity is selected by control input CPOL
RXEN	J7	CMOS In	Disables the CMOS Drivers and turns off the PLL, putting device in shutdown mode. ⁽²⁾ 1: Receiver enabled 0: Receiver disabled (shutdown)
SWAP	J2	CMOS In	Bus swap: swaps the bus pins to allow device placement on top or bottom of PCB. See pinout drawing and 表 5-2 for pin assignments. 0: data output from R7 to B0 1: data output from B0 to R7
VS	H8	CMOS Out	Vertical sync
SUBLVDS			
CLK+, CLK -	J3, J4	SubLVDS In	SubLVDS input pixel clock (polarity is fixed)
D0+, D0 -	J5, J6	SubLVDS In	SubLVDS data link (active during normal operation)
D1+, D1 -	F1, G1	SubLVDS In	SubLVDS data link (active during normal operation when LS0 = high and LS1 = low, or LS0 = low and LS1 = high; high impedance if LS0 = LS1 = low); input can be left open if unused.
D2+, D2 -	D1, E1	SubLVDS In	SubLVDS data link (active during normal operation when LS0 = low and LS1 = high, high-impedance when LS1 = low); input can be left open if unused.
POWER SUPPLY			
V _{DD}	C2, C4, C6, D7 to G7	Power Supply	Supply voltage
V _{DDL} VDS	H2, H5	Power Supply	SubLVDS I/O supply voltage
V _{DD} PLLA	H3	Power Supply	PLL analog supply voltage
V _{DD} PLLD	F2	Power Supply	PLL digital supply voltage
GND	A1, A9, C5, C7, D3 to D6, E3 to E6, F3 to F6, G3 to G6, H7	Ground	Supply ground
GND _{LVDS}	G2, H6, J1	Ground	SubLVDS ground
GND _{PLLA}	H4	Ground	PLL analog ground
GND _{PLLD}	E2	Ground	PLL digital ground

(1) Pin assignment depends on SWAP pin setting. Swappable pins are detailed in 表 5-2.

(2) RXEN input incorporates glitch suppression logic to avoid unwanted switching. The input must be pulled low for longer than 10 μ s continuously to force the receiver to enter Shutdown. The input must be pulled high for at least 10 μ s continuously to activate the

receiver. An input pulse shorter than 5 μ s is interpreted as glitch and becomes ignored. At power up, the receiver is enabled immediately if RXEN = H and disabled if RXEN = L.

表 5-2. Swappable Pins

SIGNAL	SWAP ⁽¹⁾	PIN	SIGNAL	SWAP ⁽¹⁾	PIN	SIGNAL	SWAP ⁽¹⁾	PIN
B0	L	F9	G0	L	B9	R0	L	A5
	H	B1		H	B5		H	C8
B1	L	F8	G1	L	B8	R1	L	B4
	H	A2		H	A6		H	C9
B2	L	E9	G2	L	A8	R2	L	A4
	H	B2		H	B6		H	D8
B3	L	E8	G3	L	B7	R3	L	B3
	H	A3		H	A7		H	D9
B4	L	D9	G4	L	A7	R4	L	A3
	H	B3		H	B7		H	E8
B5	L	D8	G5	L	B6	R5	L	B2
	H	A4		H	A8		H	E9
B6	L	C9	G6	L	A6	R6	L	A2
	H	B4		H	B8		H	F8
B7	L	C8	G7	L	B5	R7	L	B1
	H	A5		H	B9		H	F9

(1) The SWAP pin is either set to GND (L) or V_{DD} (H).

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage range	V_{DD} ⁽²⁾ , V_{DDPLLA} , V_{DDPLLD} , V_{DDLVDs}	- 0.3	2.175	V
Voltage range at any input or output terminal	When $V_{DDx} > 0$ V	- 0.5	2.175	V
	When $V_{DDx} \leq 0$ V	- 0.5	$V_{DD} + 2.175$	
Output current, I_O		± 5		mA
Storage temperature, T_{stg}		- 55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to the GND terminals

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	± 4000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	± 1500	
	Machine model	± 200	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

see ⁽¹⁾

		MIN	NOM	MAX	UNIT	
V_{DD}	Supply voltages	1.65	1.8	1.95	V	
V_{DDPLLA}						
V_{DDPLLD}						
V_{DDLVDs}						
$V_{DDn(PP)}$ Supply voltage noise magnitude 50 MHz (all supplies)	Test set-up see 图 7-1				mV	
	$f_{CLK} \leq 50$ MHz; $f(\text{noise}) = 1$ Hz to 2 GHz			100		
	$f_{CLK} > 50$ MHz; $f(\text{noise}) = 1$ Hz to 1 MHz			100		
	$f_{CLK} > 50$ MHz; $f(\text{noise}) > 1$ MHz			40		
T_A Operating free-air temperature		- 40		85	°C	
CLK+ and CLK -						
$f_{CLK\pm}$ Input Pixel clock frequency	1-Channel receive mode, see 图 8-4		4		15	MHz
	2-Channel receive mode, see 图 8-5		8		30	
	3-Channel receive mode, see 图 8-6		20		65	
	Standby mode ⁽²⁾ , see 图 7-10				500	kHz
t_{DUTCLK} CLK Input Duty Cycle		35%		65%		

see (1)

		MIN	NOM	MAX	UNIT	
D0+, D0 -, D1+, D1 -, D2+, D2 -, CLK+, and CLK -						
$ V_{ID} $	Magnitude of differential input voltage	$ V_{D0+} - V_{D0-} , V_{D1+} - V_{D1-} , V_{D2+} - V_{D2-} ,$ $ V_{CLK+} - V_{CLK-} $ during normal operation		70	200	mV
V_{ICM}	Input voltage common mode range	Receive or Acquire mode		0.6	1.2	V
		Stand-by mode		$0.9 \times V_{DDLVD5}$		
ΔV_{ICM}	Input voltage common mode variation between all SubLVDS inputs	$V_{ICM(n)} - V_{ICM(m)}$ with $n = \{D0, D1, D2, \text{ or } CLK\}$ and $m = \{D0, D1, D2, \text{ or } CLK\}$		- 100	100	mV
ΔV_{ID}	Differential input voltage amplitude variation between all SubLVDS inputs	$V_{ID(n)} - V_{ID(m)}$ with $n = \{D0, D1, D2, \text{ or } CLK\}$ and $m = \{D0, D1, D2, \text{ or } CLK\}$		- 10%	10%	
$t_{R/F}$	Input rise and fall time	RXEN at VDD; see figure 10			800	ps
$\Delta t_{R/F}$	Input rise or fall time mismatch between all SubLVDS inputs	$t_{R(n)} - t_{R(m)}$ and $t_{F(n)} - t_{F(m)}$ with $n = \{D0, D1, D2, \text{ or } CLK\}$ and $m = \{D0, D1, D2, \text{ or } CLK\}$		- 100	100	ps
LS0, LS1, CPOL, SWAP, RXEN, F/S						
V_{ICMOSH}	High-level input voltage	$0.7 \times V_{DD}$		V_{DD}		V
V_{ICMOSL}	Low-level input voltage	0		$0.3 \times V_{DD}$		V
t_{inRXEN}	RXEN input pulse duration	10				μs
R[7:0], G[7:0], B[7:0], VS, HS, PCLK, CPE						
C_L	Output load capacitance	10				pF

- Unused single-ended inputs must be held high or low to prevent them from floating.
- PCLK input frequencies lower than 500 kHz forces the SN65LVDS302 into standby mode. Input frequencies from 500 kHz to 3 MHz may or may not activate the SN65LVDS302. Input frequencies beyond 3 MHz activate the SN65LVDS302. TI recommends against input frequencies from 500 kHz to 4 MHz, which can cause PLL malfunction.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		SN65LVDS302		UNIT
		ZXH (nFBGA)		
		80 PINS		
$R_{\theta JA}$	Junction-to-ambient thermal resistance	41.5		$^{\circ}C/W$
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	29.4		$^{\circ}C/W$
$R_{\theta JB}$	Junction-to-board thermal resistance	23.8		$^{\circ}C/W$
ψ_{JT}	Junction-to-top characterization parameter	0.5		$^{\circ}C/W$
ψ_{JB}	Junction-to-board characterization parameter	23.9		$^{\circ}C/W$

- For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP ⁽¹⁾	MAX	UNIT
I_{DD}	RMS supply current	1ChM Alternating 1010 Test pattern (see 表 7-5). All CMOS outputs terminated with 10 pF, F/S and RXEN at V_{DD} . $V_{IH} = V_{DD}$, $V_{IL} = 0$ V, $V_{DD} = V_{DDPLLA} = V_{DDPLLD} = V_{DDLVDs}$	$f_{PCLK} = 4$ MHz	9.8	14	mA
			$f_{PCLK} = 6$ MHz	11.7	15.9	
			$f_{PCLK} = 15$ MHz	19.3	25	
		Typical power test pattern (see 表 7-2). $V_{ID} = 70$ mV. All CMOS outputs terminated with 10 pF, F/S at GND, and RXEN at V_{DD} . $V_{IH} = V_{DD}$, $V_{IL} = 0$ V, $V_{DD} = V_{DDPLLA} = V_{DDPLLD} = V_{DDLVDs}$	$f_{PCLK} = 4$ MHz	4.7	mA	
			$f_{PCLK} = 6$ MHz	6		
			$f_{PCLK} = 15$ MHz	13.2		
	2ChM	Alternating 1010 Test pattern (see 表 7-5). All CMOS outputs terminated with 10 pF, F/S and RXEN at V_{DD} . $V_{IH} = V_{DD}$, $V_{IL} = 0$ V, $V_{DD} = V_{DDPLLA} = V_{DDPLLD} = V_{DDLVDs}$	$f_{PCLK} = 8$ MHz	14.3	19.4	mA
			$f_{PCLK} = 22$ MHz	25	33	
			$f_{PCLK} = 30$ MHz	26.8	37	
		Typical power test pattern (see 表 7-3). $V_{ID} = 70$ mV. All CMOS outputs terminated with 10 pF, F/S at GND, and RXEN at V_{DD} . $V_{IH} = V_{DD}$, $V_{IL} = 0$ V, $V_{DD} = V_{DDPLLA} = V_{DDPLLD} = V_{DDLVDs}$	$f_{PCLK} = 8$ MHz	6.4	mA	
			$f_{PCLK} = 22$ MHz	13.7		
			$f_{PCLK} = 30$ MHz	18.3		
3ChM	Alternating 1010 Test pattern (see 表 7-5). All CMOS outputs terminated with 10 pF, F/S and RXEN at V_{DD} . $V_{IH} = V_{DD}$, $V_{IL} = 0$ V, $V_{DD} = V_{DDPLLA} = V_{DDPLLD} = V_{DDLVDs}$	$f_{PCLK} = 20$ MHz	17.1	27	mA	
		$f_{PCLK} = 65$ MHz	60.8	68		
		$f_{PCLK} = 65$ MHz	22.2			
	Typical power test pattern (see 表 7-4). $V_{ID} = 70$ mV. All CMOS outputs terminated with 10 pF, F/S at GND, and RXEN at V_{DD} . $V_{IH} = V_{DD}$, $V_{IL} = 0$ V, $V_{DD} = V_{DDPLLA} = V_{DDPLLD} = V_{DDLVDs}$	$f_{PCLK} = 20$ MHz	8.6	mA		
		$f_{PCLK} = 65$ MHz	22.2			
		$f_{PCLK} = 65$ MHz	22.2			
CLK and D[0:2] inputs are left open. All control inputs held static high or low. All CMOS outputs terminated with 10 pF. $V_{IH} = V_{DD}$, $V_{IL} = 0$ V, $V_{DD} = V_{DDPLLA} = V_{DDPLLD} = V_{DDLVDs}$		Standby mode; RXEN = V_{IH}	15	100	μ A	
		Shutdown mode; RXEN = V_{IL}	0.4	10	μ A	

(1) All typical values are at 25°C and with 1.8-V supply unless otherwise noted.

6.6 Input Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP ⁽¹⁾	MAX	UNIT
D0+, D0-, D1+, D1-, D2+, D2-, CLK+, and CLK-						
V_{thstby}	Input voltage common mode threshold to switch between receive and acquire mode and standby mode	RXEN at V_{DD}	1.3	$0.9 \times V_{DDLVD5}$		V
V_{THL}	Low-level differential input voltage threshold	$V_{D0+} - V_{D0-}, V_{D1+} - V_{D1-}, V_{D2+} - V_{D2-}, V_{CLK+} - V_{CLK-}$	-40			mV
V_{THH}	High-level differential input voltage threshold	$V_{D0+} - V_{D0-}, V_{D1+} - V_{D1-}, V_{D2+} - V_{D2-}, V_{CLK+} - V_{CLK-}$			40	mV
I_{I+}, I_{I-}	Input leakage current	$V_{DD} = 1.95\text{ V}, V_{I+} = V_{I-}, V_{I+} = 0.4\text{ V}$ and $V_{I-} = 1.5\text{ V}$			75	μA
I_{OFF}	Power-off input current	$V_{DD} = \text{GND}; V_{I+} = 1.5\text{ V}$			-75	μA
R_{ID}	Differential input termination resistor value		78	100	122	Ω
C_{IN}	Input capacitance	Measured between input terminal and GND		1		pF
ΔC_{IN}	Input capacitance variation	Within one signal pair			0.2	pF
		Between all signals			1	
R_{BDDC}	Pull-up resistor for standby detection		21	30	39	k Ω
LS0, LS1, CPOL, SWAP, RXEN, F/S						
V_{IK}	Input clamp voltage	$I_{I-} = -18\text{ mA}, V_{DD} = V_{DD}(\text{min})$			-1.2	V
I_{ICMOS}	Input current ⁽²⁾	$0\text{ V} \leq V_{DD} \leq 1.95\text{ V}; V_{I+} = \{\text{GND}, 1.95\text{ V}\}$			100	nA
C_{IN}	Input capacitance			2		pF
I_{IH}	High-level input current	$V_{IN} = 0.7 \times V_{DD}$	-200		200	nA
I_{IL}	Low-level input current	$V_{IN} = 0.3 \times V_{DD}$	-200		200	nA
V_{IH}	High-level input voltage		$0.7 \times V_{DD}$		V_{DD}	V
V_{IL}	Low-level input voltage		0		$0.3 \times V_{DD}$	V

(1) All typical values are at 25°C and with 1.8-V supply unless otherwise noted.

(2) Do not leave any CMOS Input unconnected or floating to minimize leakage currents. Every input must be connected to a valid logic level V_{IH} or V_{OL} while power is supplied to V_{DD} .

6.7 Output Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
R[0:7], G[0:7], B[0:7], VS, HS, PCLK, CPE						
V_{OH}	High-level output current	1-ChM, F/S = L, $I_{OH} = -250\ \mu\text{A}$	$0.8 \times V_{DD}$		V_{DD}	V
		2- or 3-ChM, F/S = L, $I_{OH} = -500\ \mu\text{A}$				
		1-ChM, F/S = H, $I_{OH} = -500\ \mu\text{A}$				
		2- or 3-ChM, F/S = H, $I_{OH} = -2\text{ mA}$				
V_{OL}	Low-level output current	1-ChM, F/S = L, $I_{OL} = 250\ \mu\text{A}$	0		$0.2 \times V_{DD}$	V
		2- or 3-ChM, F/S = L, $I_{OL} = 500\ \mu\text{A}$				
		1-ChM, F/S = H, $I_{OL} = 500\ \mu\text{A}$				
		2- or 3-ChM, F/S = H, $I_{OL} = 2\text{ mA}$				
I_{OH}	High-level output current	1-ChM, F/S = L	-250			μA
		2- or 3-ChM, F/S = L; 1-ChM, F/S = H	-500			
		2- or 3-ChM, F/S = H	-2000			

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_{OL} Low-level output current	1-ChM, F/S = L			250	μ A
	2- or 3-ChM, F/S = L; 1-ChM, F/S = H			500	
	2- or 3-ChM, F/S = H			2000	

6.8 Timing Requirements

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{RSKMx} (2) (3) Receiver input skew margin ⁽¹⁾ (see 图 9-2)	1ChM: $x = 0.29$, $f_{PCLK} = 15$ MHz, RXEN at V_{DD} , $V_{IH} = V_{DD}$, $V_{IL} = GND$, $R_L = 100 \Omega$, test setup as in 图 7-2, test pattern as in 表 7-7	$f_{CLK} = 15$ MHz ⁽⁴⁾		630	ps
		$f_{CLK} = 4$ MHz to 15 MHz ⁽⁵⁾		$1 / (60 \times f_{CLK}) - 480$	
	2ChM: $x = 0.14$, $f_{PCLK} = 30$ MHz, RXEN at V_{DD} , $V_{IH} = V_{DD}$, $V_{IL} = GND$, $R_L = 100 \Omega$, test setup as in 图 7-2, test pattern as in 表 7-8	$f_{CLK} = 30$ MHz ⁽⁴⁾		630	
		$f_{CLK} = 8$ MHz to 30 MHz ⁽⁵⁾		$1 / (30 \times f_{CLK}) - 480$	
	3ChM: RXEN at V_{DD} , $V_{IH} = V_{DD}$, $V_{IL} = GND$, test setup as in 图 7-2, test pattern as in 表 7-9	$f_{CLK} = 65$ MHz ⁽⁴⁾		360	
		$f_{CLK} = 20$ MHz to 65 MHz ⁽⁵⁾		$1 / (20 \times f_{CLK}) - 410$	

- (1) This includes the receiver internal set-up and hold time uncertainty, all PLL related high-frequency random and deterministic jitter components that impact the jitter budget, ISI and duty cycle distortion from the front end receiver, and the skew from CLK to data D0, D1, and D2; The pulse position minimum and maximum variation is given with a bit error rate target of 10^{-12} ; Measurements of the total jitter are taken over a sample amount of $> 10^{-12}$ samples.
- (2) Receiver Input Skew Margin (t_{RSKM}) is the timing margin available for transmitter output pulse position (t_{PPoS}), interconnect skew, and interconnect inter-symbol interference. t_{RSKM} represents the remainder of the serial bit time not taken up by the receiver strobe uncertainty; The t_{RSKM} assumes a bit error rate better than 10^{-12} .
- (3) t_{RSKM} is indirectly proportional to the internal set-up and hold time uncertainty, ISI and duty cycle distortion from the front end receiver, the skew mismatch from CLK to data D0, D1, and D2, as well as the PLL cycle-to-cycle jitter.
- (4) The Minimum and Maximum Limits are based on statistical analysis of the device performance over process, voltage, and temp ranges.
- (5) These Minimum and Maximum Limits are simulated only.

6.9 Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP ⁽¹⁾	MAX	UNIT

over recommended operating conditions (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP ⁽¹⁾	MAX	UNIT
$t_{PD(L)}$	Propagation delay time from CLK+ input to PCLK output RXEN at V_{DD} , $V_{IH} = V_{DD}$, $V_{IL} = GND$, $C_L = 10$ pF, see 图 7-8	$1.4 / f_{PCLK}$	$1.9 / f_{PCLK}$	$2.5 / f_{PCLK}$	s
t_{GS}	RXEN glitch suppression pulse width ⁽⁴⁾ $V_{IH} = V_{DD}$, $V_{IL} = GND$, RXEN toggles from V_{IL} to V_{IH} ; see 图 7-9 and 图 7-10			3.8	μ s
t_{pwrap}	Enable time from power down (\uparrow RXEN) Time from RXEN pulled high to data outputs enabled and outputs valid data; see 图 7-10			2	ms
t_{pwrdn}	Disable time from active mode (\downarrow RXEN) RXEN is pulled low during receive mode; time measurement until all outputs held static: $R[0:7] = G[0:7] = B[0:7] = VS = HS = high$, $DE = PCLK = low$ and PLL is Shutdown; see 图 7-10			11	μ s
t_{wakeup}	Enable time from Standby ($\uparrow \downarrow$ CLK) RXEN at V_{DD} ; device is in standby; time measurement from CLK input starts switching to PCLK and data outputs enabled and outputting valid data; see 图 7-11			2	ms
t_{sleep}	Disable time from active mode (CLK transitions to high-impedance) RXEN at V_{DD} ; device is receiving data; time measurement from CLK input signal stops (input open or input common mode VICM exceeds threshold voltage V_{thstby}) until all outputs held static: $R[0:7] = G[0:7] = B[0:7] = VS = HS = high$, $DE = PCLK = low$ and PLL is Shutdown; see 图 7-11			3	μ s
f_{BW}	PLL bandwidth ⁽⁵⁾ Tested from CLK input to PCLK output	2-ChM; $f_{PCLK} = 22$ MHz	$0.087 \times f_{PCLK}$		MHz
		3-ChM; $f_{PCLK} = 65$ MHz	$0.075 \times f_{PCLK}$		

- (1) All typical values are at 25°C and with 1.8-V supply unless otherwise noted.
- (2) $t_{R/F}$ depends on the F/S setting and the capacitive load connected to each output. Some application information of how to calculate $t_{R/F}$ based on the output load and how to estimate the timing budget to interconnect to an LCD driver are provided in the application section near the end of this data sheet.
- (3) The output rise and fall time is optimized for an output load of 10 pF. The rise and fall time can be adjusted by changing the output load capacitance.
- (4) The RXEN input incorporates a glitch-suppression logic to disregard short input pulses. t_{GS} is the duration of either a high-to-low or low-to-high transition that is suppressed.
- (5) When using the SN65LVDS302 receiver in conjunction with the SN65LVDS301 transmitter in one link, the PLL bandwidth of the SN65LVDS302 receiver always exceed the bandwidth of the SN65LVDS301 transmit PLL. This ensures stable PLL tracking under all operating conditions and maximizes the receiver skew margin.

6.10 Device Power Dissipation

PARAMETER	TEST CONDITIONS	TYP	MAX	UNIT
P_D	$V_{DDx} = 1.8$ V, $T_A = 25^\circ$ C, all outputs terminated with 10 pF	$f_{CLK} = 4$ MHz	16.8	mW
		$f_{CLK} = 65$ MHz	64.7	
	$V_{DDx} = 1.95$ V, $T_A = -40^\circ$ C, all outputs terminated with 10 pF	$f_{CLK} = 4$ MHz	27.4	mW
		$f_{CLK} = 65$ MHz	128.8	

Typical Characteristics

7.2 Typical IC Power Consumption Test Pattern

Typical power-consumption test patterns consist of sixteen 30-bit receive words in 1-channel mode, eight 30-bit receive words in 2-channel mode and five 30-bit receive words in 3-channel mode. The pattern repeats itself throughout the entire measurement. It is assumed that every possible code on the RGB outputs has the same probability to occur during typical device operation.

7.3 Maximum Power Consumption Test Pattern

The maximum (or worst-case) power consumption of the SN65LVDS302 is tested using the two different test pattern shown in table. Test patterns consist of sixteen 30-bit receive words in 1-channel mode, eight 30-bit receive words in 2-channel mode, and five 30-bit receive words in 3-channel mode. The pattern repeats itself throughout the entire measurement. It is assumed that every possible code on RGB outputs has the same probability to occur during typical device operation.

7.4 Output Skew Pulse Position and Jitter Performance

The following test patterns are used to measure the output skew pulse position and the jitter performance of the SN65LVDS302. The jitter test pattern stresses the interconnect, particularly to test for ISI, using very long run-lengths of consecutive bits, and incorporating very high and low data rates, maximizing switching noise. Each pattern is self-repeating for the duration of the test.

8 Detailed Description

8.1 Overview

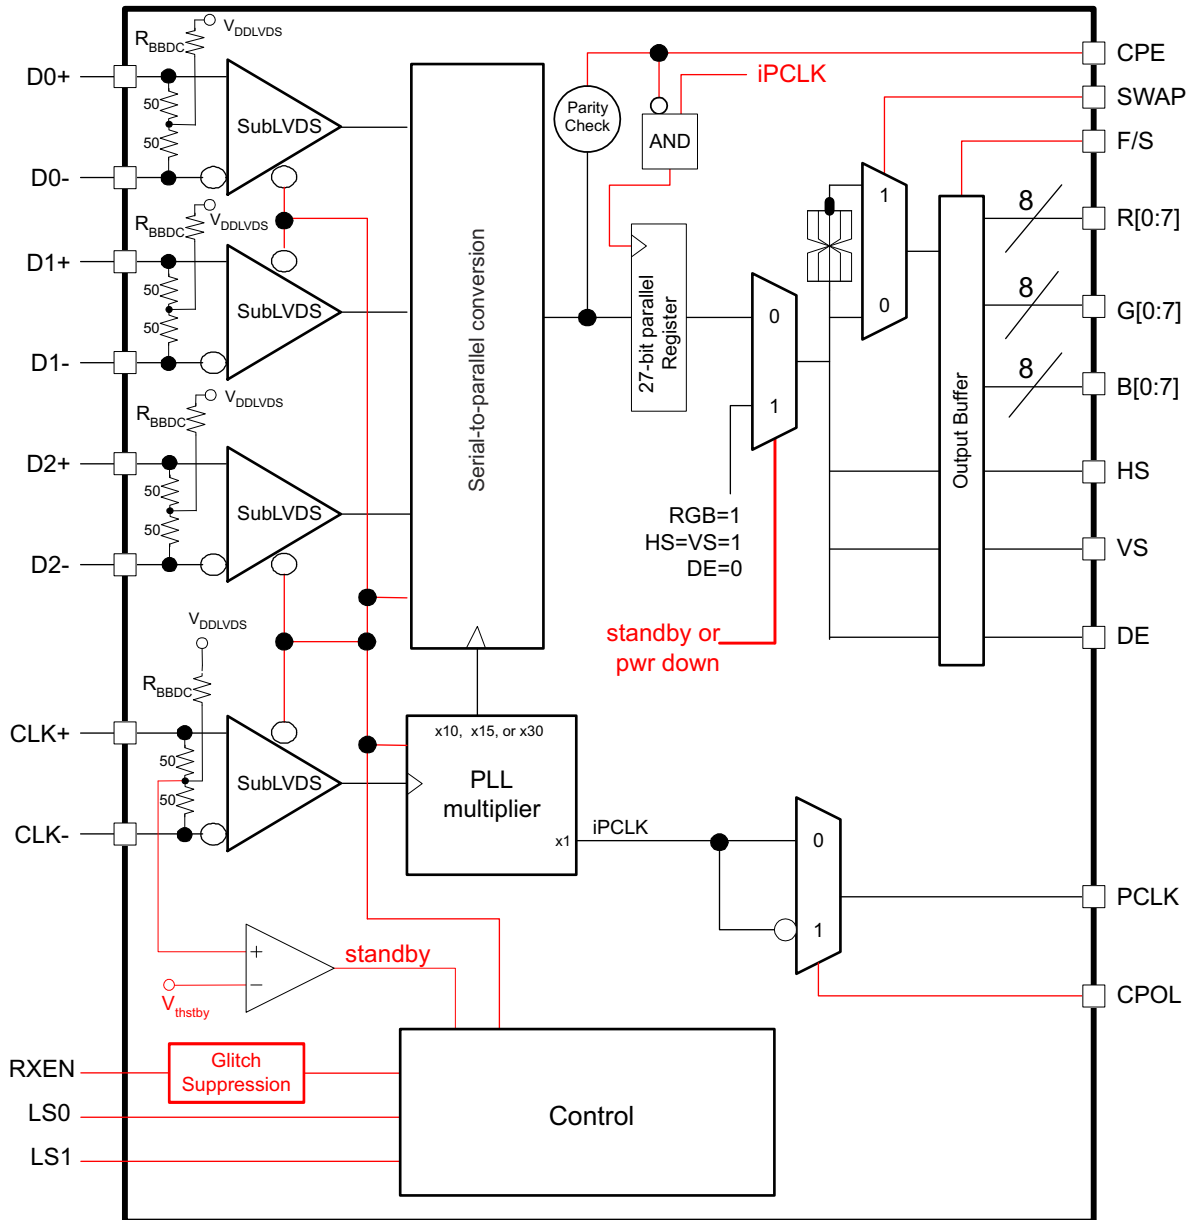

The SN65LVDS302 is a de-serialising device where the input serial data and clock are received through Sub Low-Voltage Differential Signaling (SubLVDS) lines. The SN65LVDS302 supports three operating power modes (Shutdown, Standby, and Active) to conserve power.

Two Link Select lines LS0 and LS1 select whether 1, 2, or 3 serial links are used. The RXEN input may be used to put the SN65LVDS302 in a Shutdown mode. The SN65LVDS302 enters an active Standby mode if the common mode voltage of the CLK input becomes shifted to V_{DDLVDs} , as when the transmitter releases the CLK output into high-impedance. This minimizes power consumption without the need of switching an external control pin. The SN65LVDS302 is characterized for operation over ambient air temperatures of -40°C to 85°C . All CMOS and SubLVDS signals are 2-V tolerant with $V_{DD} = 0$ V. This feature allows signal power-up before V_{CC} is stabilized.

When receiving, the PLL locks to the incoming clock (CLK) and generates an internal high-speed clock at the line rate of the data lines. The data is serially loaded into a shift register using the internal high-speed clock. The de-serialized data is presented on the parallel output bus with a recreation of the Pixel clock (PCLK) generated from the internal high-speed clock. If no input CLK signal is present, the output bus is held static with the PCLK and DE held low, while all other parallel outputs are pulled high.

The parallel (CMOS) output bus offers a bus-swap feature. The SWAP control pin controls the output pin order of the output pixel data to be either R[7:0], G[7:0], B[7:0], VS, HS, DE or B[0:7], G[0:7], R[0:7], VS, HS, DE. This gives a PCB designer the flexibility to better match the bus to the LCD driver pinout or to put the receiver device on the top side or the bottom side of the PCB. The F/S control input selects between a slow CMOS bus output rise time for best EMI and power consumption and a fast CMOS output for increased speed or higher load designs.

8.3 Feature Description

8.3.1 Swap Pin Functionality

The SWAP pin allows the pcb designer to reverse the RGB bus, minimizing potential signal crossovers due to signal routing. The two drawings beneath show the RGB signal pin assignment based on the SWAP pin setting.

图 8-1. Pinout With SWAP PIN = GND

图 8-2. Pinout With SWAP PIN = VDD

8.3.2 Parity Error Detection and Handling

The SN65LVDS302 receiver performs error checking on the basis of a parity bit that is transmitted across the subLVDS interface from the transmitting device. Once the SN65LVDS302 detects the presence of the clock and the PLL has locked onto PCLK, then the parity is checked. Parity-error detection ensures detection of all single bit errors in one pixel and 50% of all multi-bit errors.

The parity bit covers the 27 bit data payload consisting of 24 bits of pixel data plus VS, HS, and DE. Odd Parity bit signalling is used. The parity error is output on the CPE pin. If the sum of the 27 data bits and the parity bit result in an odd number, the receive data are assumed to be valid. The CPE output is held low. If the sum equals an even number, parity error is declared. The CPE output indicates high for half a PCLK period. The CPE output is set with the data bit transition and cleared after 1/2 the data bit time. This allows counting every detected parity error with a simple counter connected to CPE.

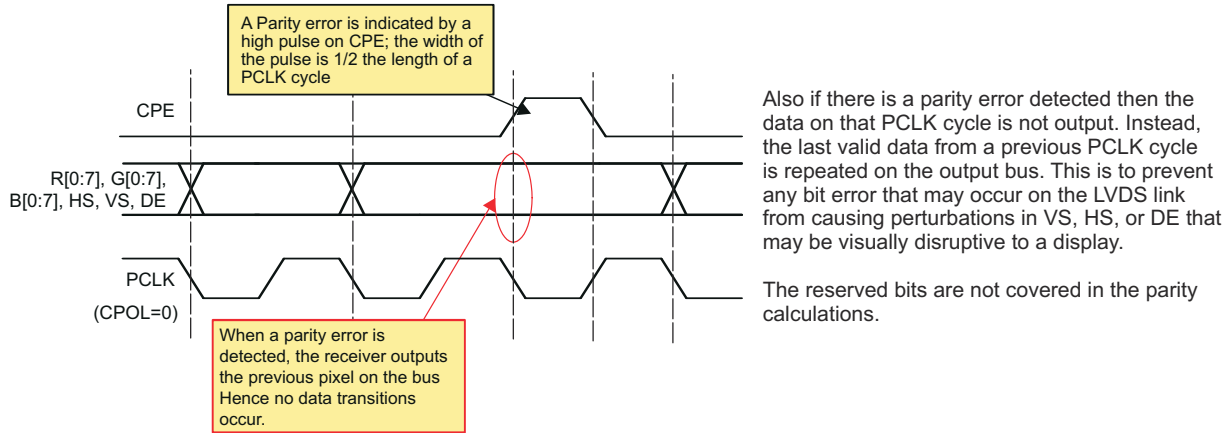

图 8-3. Parity Error Detection and Handling

8.4 Device Functional Modes

8.4.1 Deserialization Modes

The SN65LVDS302 receiver has three modes of operation controlled by link-select pins LS0 and LS1. 表 8-1 shows the deserializer modes of operation.

表 8-1. Logic Table: Link Select Operating Modes

LS1	LS0	MODE OF OPERATION		DATA LINKS STATUS
0	0	1ChM	1-channel mode (30-bit serialization rate)	D0 active; D1, D2 disabled
0	1	2ChM	2-channel mode (15-bit serialization rate)	D0, D1 active; D2 disabled
1	0	3ChM	3-channel mode (10-bit serialization rate)	D0, D1, D2 active
1	1		Reserved	Reserved

8.4.1.1 1-Channel Mode

While LS0 and LS1 are held low, the SN65LVDS302 receives payload data over a single SubLVDS data pair, D0. The PLL locks to the SubLVDS clock input and internally multiplies the clock by a factor of 30. The internal high speed clock is used to shift in the data payload on D0 and to deserialize 30 bits of data. 图 8-4 illustrates the timing and the mapping of the data payload into the 30-bit frame. The internal high speed clock is divided by a factor of 30 to recreate the pixel clock and the data payload with the pixel clock is presented on the output bus. The reserved bits and parity bit are not output. While in this mode, the PLL can lock to a clock that is in the range of 4 MHz through 15 MHz. This mode is intended for smaller video display formats that do not need the full bandwidth capabilities of the SN65LVDS302.

图 8-4. Data and Clock Input in 1-ChM (LS0 and LS1 = low)

8.4.1.2 2-Channel Mode

While LS0 is held high and LS1 is held low, the SN65LVDS302 receives payload data over two SubLVDS data pairs, D0 and D1. The PLL locks to the SubLVDS clock input and internally multiplies the clock by a factor of 15. The internal high speed clock is used to shift in the data payload on D0 and D1 and to deserialize 15 bits of data from each pair. 图 8-5 illustrates the timing and the mapping of the data payload into the 30-bit frame. The internal high speed clock is divided by a factor of 15 to recreate the pixel clock, and the data payload with pixel clock is presented on the output bus. The reserved bits and parity bit are not output. While in this mode the PLL can lock to a clock that is in the range of 8 MHz through 30 MHz.

图 8-5. Data and Clock Input in 2-ChM (LS0 = high; LS1 = low)

8.4.1.3 3-Channel Mode

While LS0 is held low and LS1 is held high the SN65LVDS302 receives payload data over three SubLVDS data pairs: D0, D1, and D2. The PLL locks to the SubLVDS clock input and internally multiplies the clock by a factor of 10. The internal high speed clock is used to shift in the data payload on D0, D1, and D2, and to deserialize 10 bits of data from each pair. 图 8-6 illustrates the timing and the mapping of the data payload into the 30-bit frame. While in this mode the PLL can lock to a clock that is in the range of 20 MHz through 65 MHz.

图 8-6. Data and Clock Input in 3-ChM (LS0 = low; LS1 = high)

8.4.2 Powerdown Modes

The SN65LVDS302 Receiver has two powerdown modes to facilitate efficient power management.

8.4.2.1 Shutdown Mode

A low input signal on the RXEN pin puts the SN65LVDS302 into Shutdown mode. This turns off most of the receiver circuitry including the SubLVDS receivers, PLL, and deserializers. The subLVDS differential-input resistance remains 100 Ω, while any input signal is ignored. All outputs hold a static output pattern:

R[0:7] = G[0:7] = B[0:7] = VS = HS = high; DE = PCLK = low.

The current draw in Shutdown mode is nearly zero if the SubLVDS inputs are left open or pulled high.

8.4.2.2 Standby Mode

The SN65LVDS302 enters the Standby mode when the SN65LVDS302 is not in Shutdown mode but the SubLVDS clock-input common-mode voltage is above $0.9 \times V_{DDLVDs}$. The CLK input incorporates a pull-up circuit to shift the SubLVDS clock-input common-mode voltage to V_{DDLVDs} in the absence of an input signal. All circuitry except the SubLVDS clock-input Standby monitor is shut down. The SN65LVDS302 also enters Standby mode when the input clock frequency on the CLK input is less than 500 kHz. The SubLVDS input resistance remains 100 Ω while any input signal on the data inputs D0, D1, and D2 becomes ignored. All outputs holds a static output pattern:

R[0:7] = G[0:7] = B[0:7] = VS = HS = high; DE = PCLK = low.

The current drawn in Standby mode is very low.

8.4.3 Active Modes

A high input signal on RXEN combined with a CLK input signal switching faster than 3 MHz and V_{ICM} smaller than 1.3 V forces the SN65LVDS302 into Active mode. Current consumption in active mode depends on operating frequency and the number of data transitions in the data payload. CLK-input frequencies from 3 MHz to 4 MHz activates the device but proper PLL functionality is not secured. The SN65LVDS302 must not be operated in active mode at CLK frequencies below 4 MHz.

8.4.3.1 Acquire Mode (PLL Approaches Lock)

When the SN65LVDS302 is enabled and a SubLVDS clock input present, the PLL pursues lock to the input clock. While the PLL pursues lock the output data bus holds a static output pattern:

$R[0:7] = G[0:7] = B[0:7] = VS = HS = \text{high}$; $DE = PCLK = \text{low}$.

For proper device operation, the pixel clock frequency must fall within the valid f_{PCLK} range specified under recommended operating conditions. If the pixel clock frequency is larger than 3 MHz but smaller than $f_{PCLK(\text{min})}$, the SN65LVDS302 PLL is enabled. Under such conditions, it is possible for the PLL to lock temporarily to the pixel clock, causing the PLL monitor to release the device into active receive mode. If this happens, the PLL may or may not be properly locked to the pixel clock input, potentially causing data errors, frequency oscillation, and PLL deadlock (loss of VCO oscillation).

8.4.3.2 Receive Mode

After the PLL achieves lock the device enters the normal receive mode. The output data bus presents the de-serialized data. The PCLK output pin outputs the recovered pixel clock.

8.4.4 Status Detect and Operating Modes Flow

The SN65LVDS302 switches between the power saving and active modes in the following way:

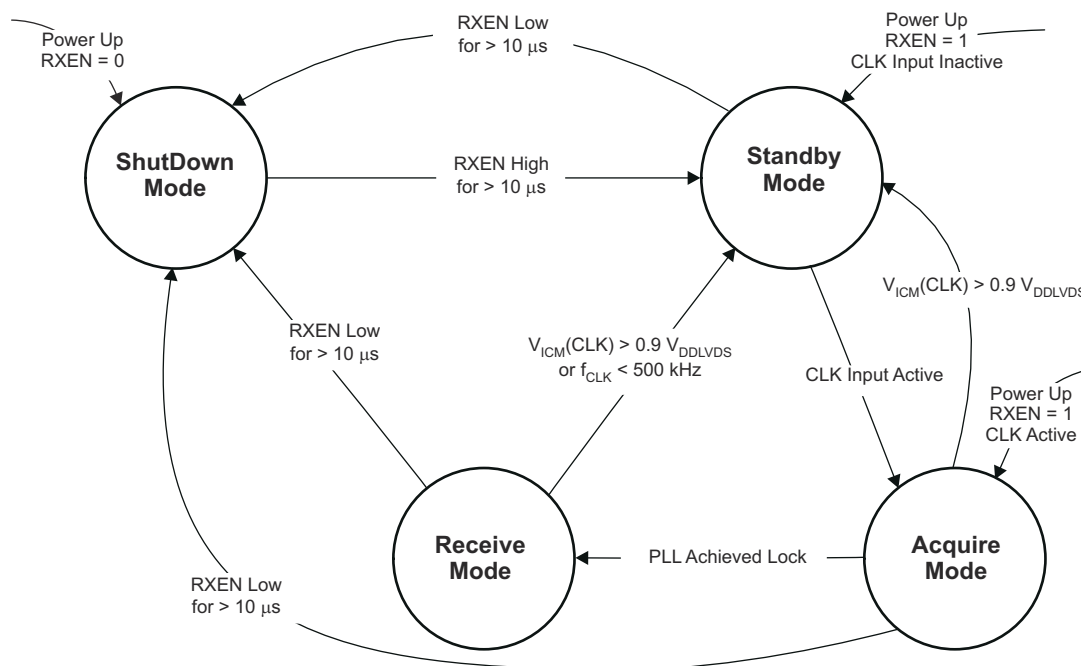

图 8-7. Operating Modes and State Machine Diagram

表 8-2. Status Detect and Operating Modes Descriptions

MODE	CHARACTERISTICS	CONDITIONS
Shutdown Mode	Least amount of power consumption (most circuitry turned off); All outputs held static: R[0:7] = G[0:7] = B[0:7] = VS = HS = high DE = PCLK = low;	RXEN is set low for longer than 10 μ s ^{(1) (2)}
Standby Mode	Low power consumption (Standby monitor circuit active; PLL is shutdown to conserve power); All outputs held static: R[0:7] = G[0:7] = B[0:7] = VS = HS = high DE = PCLK = low;	RXEN is high for longer than 10 μ s, and both CLK input common-mode $V_{ICM(CLK)}$ above $0.9 \times V_{DDLVDs}$, or CLK input floating ⁽²⁾
Acquire Mode	PLL pursues lock; All outputs held static: R[0:7] = G[0:7] = B[0:7] = VS = HS = high DE = PCLK = low;	RXEN is high; CLK input monitor detected clock input common mode and woke up receiver out of Standby mode
Receive Mode	Data transfer (normal operation); receiver deserializes data and provides data on parallel output	RXEN is high and PLL is locked to incoming clock

- (1) In Shutdown Mode, all SN65LVDS302 internal switching circuits (for example: PLL, serializer, etc.) are turned off to minimize power consumption. The input stage of any input pin remains active.
- (2) Leaving CMOS control inputs unconnected can cause random noise to toggle the input stage and potentially harm the device. All CMOS inputs must be tied to a valid logic level V_{IL} or V_{IH} during Shutdown or Standby Mode. Exceptions are the subLVDS inputs CLK and Dx, which can be left unconnected while not in use.

表 8-3. Operating Mode Transitions

MODE TRANSITION	USE CASE	TRANSITION SPECIFICS
Shutdown \rightarrow Standby	Drive RXEN high to enable receiver	<ol style="list-style-type: none"> 1. RXEN high > 10 μs 2. Receiver enters standby mode <ol style="list-style-type: none"> a. R[0:7] = G[0:7] = B[0:7] = VS = HS remain high and DE = PCLK low b. Receiver activates clock input monitor
Standby \rightarrow Acquire	Transmitter activity detected	<ol style="list-style-type: none"> 1. CLK input monitor detects clock input activity 2. Outputs remain static 3. PLL circuit is enabled
Acquire \rightarrow Receive	Link is ready to receive data	<ol style="list-style-type: none"> 1. PLL is active and approaches lock 2. PLL achieves lock within t_{wakeup} 3. D1, D2, or D3 become active depending on LS0 and LS1 selection 4. First Data word was recovered 5. Parallel output bus turns on switching from static output pattern to output first valid data word
Receive \rightarrow Standby	Transmitter requested to enter Standby mode by input common mode voltage $V_{ICM} > 0.9 V_{DDLVDs}$ as when transmitter output clock stops or enters high-impedance state.	<ol style="list-style-type: none"> 1. Receiver disables outputs within t_{sleep} 2. RX Input monitor detects $V_{ICM} > 0.9 V_{DDLVDs}$ within t_{sleep} 3. R[0:7] = G[0:7] = B[0:7] = VS = HS transition to high and DE = PCLK to low on next falling PLL clock edge 4. PLL shuts down. Clock activity input monitor remains active
Receive and Standby \rightarrow Shutdown	Turn off Receiver	<ol style="list-style-type: none"> 1. RXEN pulled low for > t_{pwrdn} 2. R[0:7] = G[0:7] = B[0:7] = VS = HS remain static high or transition to static high and DE = PCLK remain or transition to static low 3. Most IC circuitry is shut down for least power consumption

9 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 Application Information

General application guidelines and hints for LVDS drivers and receivers may be found in the [LVDS application notes and design guides](#).

9.1.2 Preventing Increased Leakage Currents in Control Inputs

A floating (left open) CMOS input allows leakage currents to flow from V_{DD} to GND. Do not leave any CMOS input unconnected or floating. Every input must be connected to a valid logic level V_{IH} or V_{OL} while power is supplied to V_{DD} . This also minimizes the power consumption of standby and power down mode.

9.1.3 Calculation Example: HVGA Display

The following calculation shows an example for a Half-VGA display with the following parameters:

Display Resolution:	480 × 320
Frame Refresh Rate:	58.4 Hz
Horizontal Visible Pixel:	480 columns
Horizontal Front Porch:	20 columns
Horizontal Sync:	5 columns
Horizontal Back Porch:	3 columns
Vertical Visible Pixel:	320 lines
Vertical Front Porch:	10 lines
Vertical Sync:	5 lines
Vertical Back Porch:	3 lines

图 9-1. HVGA Display

Calculation of the total number of pixel and blanking overhead:

Visible Area Pixel Count:	$480 \times 320 = 153600$ pixel
Total Frame Pixel Count:	$(480 + 20 + 5 + 3) \times (320 + 10 + 5 + 3) = 171704$ pixel
Blanking Overhead:	$(171704 - 153600) \div 153600 = 11.8\%$

The application requires the following serial-link parameters:

Pixel Clk Frequency:	$171704 \times 58.4 \text{ Hz} = 10 \text{ MHz}$
Serial Data Rate:	1-channel mode: $10 \text{ MHz} \times 30 \text{ bit/channel} = 300 \text{ Mbps}$ 2-channel mode: $10 \text{ MHz} \times 15 \text{ bit/channel} = 150 \text{ Mbps}$

9.1.4 How to Determine Interconnect Skew and Jitter Budget

Designing a reliable data link requires examining the interconnect skew and jitter budget. The sum of all transmitter, PCB, connector, FPC, and receiver uncertainties must be smaller than the available serial bit time. The highest pixel clock frequency defines the available serial bit time. The transmitter timing uncertainty is defined by t_{PPOS} in the transmitter data sheet. For a bit-error-rate target of $\leq 10^{-12}$, the measurement duration for t_{PPOS} is $\geq 10^{12}$. The SN65LVDS302 receiver can tolerate a maximum timing uncertainty defined by t_{RSKM} . The interconnect budget is calculated by [方程式 1](#).

$$t_{interconnect} = t_{RSKM} - t_{PPOS} \tag{1}$$

Example:

$f_{PCLK(max)}$	23 MHz (VGA display resolution, 60 Hz)
Transmission mode: 2-ChM; $t_{PPOS}(SN65LVDS301)$	330 ps
Target bit error rate	10^{-12}
$t_{RSKM}(SN65LVDS302)$	$1 / (2 \times 15 \times f_{PCLK}) - 480 \text{ ps} = 969 \text{ ps}$

The interconnect budget for cable skew and ISI must be smaller than the output of [方程式 2](#).

$$t_{interconnect} = t_{RSKM} - t_{PPOS} = 639 \text{ ps} \tag{2}$$

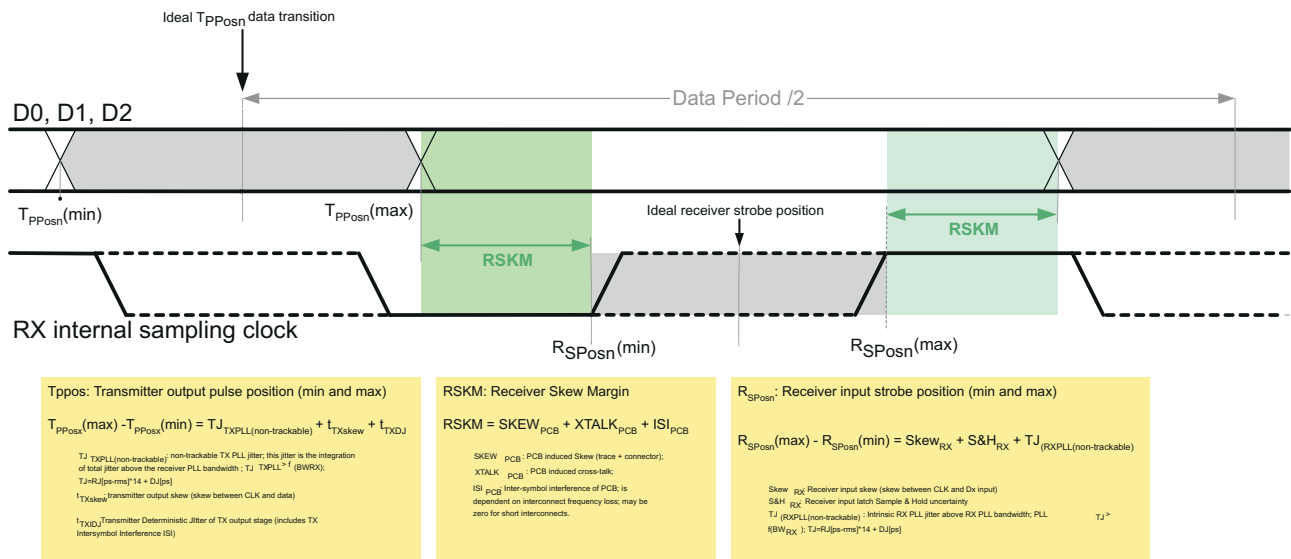

图 9-2. Jitter Budget

9.1.5 F/S Pin Setting and Connecting the SN65LVDS302 to an LCD Driver

备注

Receiver PLL tracking: To maximize the design margin for the interconnect, good RX PLL tracking of the TX PLL is important. FlatLink3G requires the RX PLL to have a bandwidth higher than the bandwidth of the TX PLL. The SN65LVDS302 PLL design is optimized to track the SN65LVDS0301 PLL particularly well, thus providing a very large receiver skew margin. A FlatLink3G-compliant link must provide at least ± 225 ppm of receiver skew margin for the interconnect.

It is important to understand the tradeoff between power consumption, EMI, and maximum speed when selecting the F/S signal. It is beneficial to choose the slowest rise time possible to minimize EMI and power consumption. Unfortunately a slower rise time also reduces the timing margin left for the LCD driver. Hence it is necessary to calculate the timing margin to select the correct F/S pin setting.

The output rise time depends on the output driver strength and the output load. An LCD driver typical capacitive load is assumed with approximately 10 pF. As the capacitive load increases, the rise time also increases. Rise time of the SN65LVDS302 is measured as the time duration it takes the output voltage to rise from 20% of V_{DD} and 80% of V_{DD} and fall time is defined as the time for the output voltage to transition from 80% of V_{DD} down to 20%.

Within one mode of operation and one F/S pin setting, the rise time of the output stage is fixed and does not adjust to the pixel frequency. Due to the short bit time at very fast pixel clock speeds and the real capacitive load of the display driver, the output amplitude might not reach V_{DD} and GND saturation fully. To ensure sufficient signal swing and verify the design margin, it becomes necessary to determine that the output amplitude under any circumstance reaches the display driver's input stage logic threshold (usually 30% and 70% of V_{DD}).

图 9-3 shows a worst-case rise time simulation assuming a LCD driver load of 16 pF at VGA display resolution. PCLK is the fastest switching output. With F/S set to GND (图 9-4), the PCLK output voltage amplitude is significantly reduced. The voltage amplitude of the output data RGB[7:0], VS, HS, and DE shows less amplitude attenuation because these outputs carry random data pattern and toggle equal or less than half of the PCLK frequency. It is necessary to determine the timing margin between the LVDS302 output and LCD driver input.

图 9-3. Output Amplitude vs Toggling Frequency (F/S = 1)

The data signal has a slower maximum switching frequency, and therefore drives a larger amplitude than the clock signal.

图 9-4. Output Amplitude vs Toggling Frequency (F/S = 0)

9.1.6 How to Determine the LCD Driver Timing Margin

To determine the timing margin, it is necessary to specify the frequency of operation, identify the set-up and hold time of the LCD driver, and specify the output load of the SN65LVDS302 as a combination of the LCD driver input parasitics plus any capacitance caused by the connecting PCB trace. Furthermore, the setting of pin F/S and the SN65LVDS302 output skew impact the margin. The total remaining design margin calculates as following:

$$t_{DM} = \frac{1}{2 \times f_{PCLK}} - t_{DUTP(max_error)} - \frac{t_{rise(max)} \times C_{LOAD}}{10 \text{ pF}} - |t_{OSK}| \quad (3)$$

where

- t_{DM} is the design margin
- f_{PCLK} is the pixel clock frequency
- $t_{DUTP(max_error)}$ is the maximum duty cycle error
- $t_{rise(max)}$ is the maximum rise or fall time; see $t_{R/F}$ under switching characteristics
- C_L is the parasitic capacitance (sum of LCD driver input parasitics + connecting PCB trace)
- t_{skew} is the clock to data output skew SN65LVDS302

Example:

At a pixel clock frequency of 5.5 MHz (QVGA), and an assumed LCD driver load of 15 pF, the remaining timing margin is:

$$t_{DUTP(max_error)} = \frac{|t_{DUTP(max)} - 50|}{100\%} \times t_{PCLK} = \frac{5\%}{100\%} \times \frac{1}{5.5 \text{ MHz}} = 9.1 \text{ ns} \quad (4)$$

$$t_{DM} = \frac{1}{2 \times 5.5 \text{ MHz}} - 9 \text{ ns} - \frac{16 \text{ ns}_{(F/S=GND)} \times 15 \text{ pF}}{10 \text{ pF}} - 500 \text{ ps} = 57.3 \text{ ns} \quad (5)$$

As long as the set-up and hold time of the LCD driver are each less than 57 ns, the timing budget is met sufficiently.

9.1.7 Typical Application Frequencies

The SN65LVDS302 supports pixel clock frequencies from 4 MHz to 65 MHz over 1, 2, or 3 data lanes. 表 9-1 provides a few typical display resolution examples and shows the number of data lanes necessary to connect the SN65LVDS302 with the display. The blanking overhead is assumed to be 20%. Often, blanking overhead is smaller, resulting in a lower data rate. Furthermore, the examples in the table assumes a display frame refresh rate of 60 Hz. The actual refresh rate may differ depending on the application-processor clock implementation.

表 9-1. Typical Application Data Rates and Serial Lane Usage

DISPLAY SCREEN RESOLUTION	VISIBLE PIXEL COUNT	BLANKING OVERHEAD	DISPLAY REFRESH RATE	PIXEL CLOCK FREQUENCY [MHz]	SERIAL DATA RATE PER LANE		
					1-ChM	2-ChM	3-ChM
176x220 (QCIF+)	38,720	20%	90 Hz	4.2 MHz	125 Mbps		
240x320 (QVGA)	76,800	20%	60 Hz	5.5 MHz	166 Mbps		
640x200	128,000	20%	60 Hz	9.2 MHz	276 Mbps	138 Mbps	
352x416 (CIF+)	146,432	20%	60 Hz	10.5 MHz	316 Mbps	158 Mbps	
352x440	154,880	20%	60 Hz	11.2 MHz	335 Mbps	167 Mbps	
320x480 (HVGA)	153,600	20%	60 Hz	11.1 MHz	332 Mbps	166 Mbps	
800x250	200,000	20%	60 Hz	14.4 MHz	432 Mbps	216 Mbps	
640x320	204,800	20%	60 Hz	14.7 MHz	442 Mbps	221 Mbps	
640x480 (VGA)	307,200	20%	60 Hz	22.1 MHz		332 Mbps	221 Mbps
1024x320	327,680	20%	60 Hz	23.6 MHz		354 Mbps	236 Mbps

表 9-1. Typical Application Data Rates and Serial Lane Usage (continued)

DISPLAY SCREEN RESOLUTION	VISIBLE PIXEL COUNT	BLANKING OVERHEAD	DISPLAY REFRESH RATE	PIXEL CLOCK FREQUENCY [MHz]	SERIAL DATA RATE PER LANE		
					1-ChM	2-ChM	3-ChM
854x480 (WVGA)	409,920	20%	60 Hz	29.5 MHz		443 Mbps	295 Mbps
800x600 (SVGA)	480,000	20%	60 Hz	34.6 MHz			346 Mbps
1024x768 (XGA)	786,432	20%	60 Hz	56.6 MHz			566 Mbps

9.2 Typical Applications

9.2.1 VGA Application

图 9-5 shows a possible implementation of a standard 640x480 VGA display. The LVDS301 interfaces to the SN65LVDS302, which is the corresponding receiver device to deserialize the data and drive the display driver. The pixel clock rate of 22 MHz assumes approximately 10% blanking overhead and 60 Hz display refresh rate. The application assumes 24-bit color resolution. Also shown is how the application processor provides a powerdown (reset) signal for both serializer and the display driver. The signal count over the Flexible Printed Circuit board (FPC) could be further decreased by using the standby option on the SN65LVDS302 and pulling RXEN high with a 30 kΩ resistor to V_{DD}.

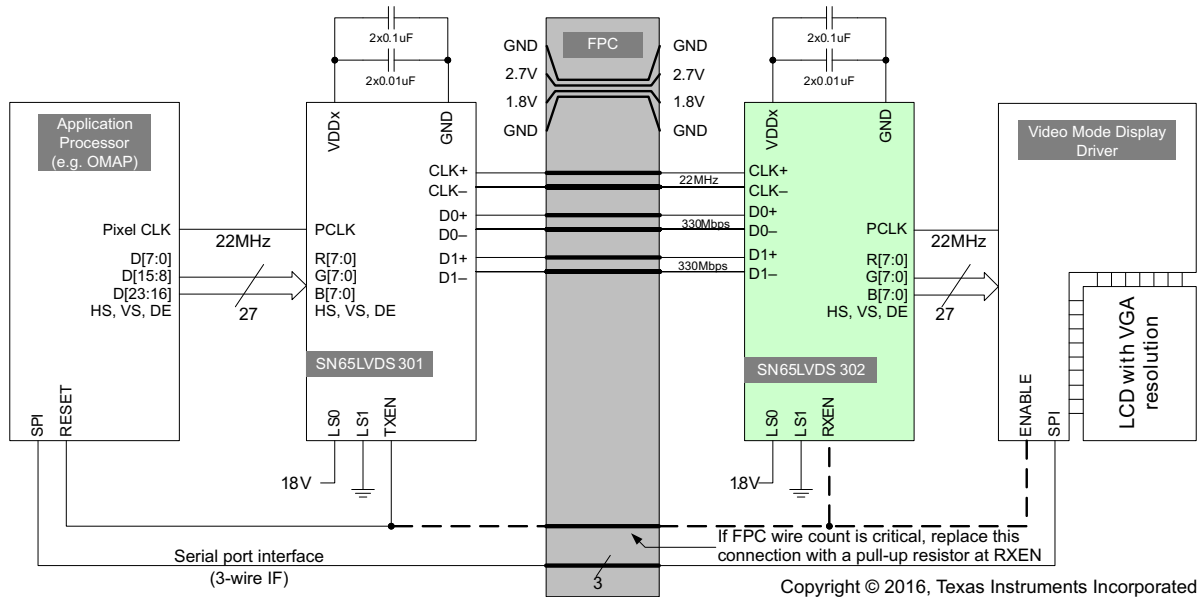

图 9-5. Typical VGA Display Application

9.2.1.1 Design Requirements

For this design example, use the parameters listed in 表 9-2 as the input parameters.

表 9-2. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Operating free-air temperature range	- 40°C to 85°C
Supply voltages, V _{DD} , V _{DDLVS} , V _{DDPLLA} , V _{DDPLLD}	1.65 V to 1.95 V
Magnitude of differential input voltage, V _{ID}	70 mV to 200 mV
Input voltage common mode range, V _{ICM}	0.6 V to 1.2 V
Receiver input skew, 2-channel mode	< 630 ps

9.2.1.2 Detailed Design Procedure

Configuration and Connection:

- Include a power supply capable of providing the power requirements of the whole system.
- Configure the Application Processor to transmit the RGB data at 22 MHz.
- Configure the transmitter and the SN65LVDS302 to work using two channels.
- Connect the SN65LVDS302 to the LCD display following the same color mapping. See [# 8.3.1](#) for more information.

9.2.1.2.1 Power-Up and Power-Down Sequences

The SN65LVDS302 does not require a specific power up sequence for the voltage lines. However, TI recommends using the power-up and power-down sequences detailed below.

Power-up sequence (SN65LVDS301 RXEN input initially low):

1. Ramp up LCD power and SN65LVDS302 (approximately 0.5 ms to 10 ms) but keep the backlight turned off.
2. Wait for an additional 0 ms to 200 ms to ensure display noise does not occur.
3. Enable video source output; start sending black video data.
4. Toggle SN65LVDS301 TXEN = V_{IH} .
5. Toggle SN65LVDS302 RXEN = V_{IH} .
6. Send at least 1 ms of black video data. This allows the SN65LVDS301 to be phase locked, and the display to show black data first.
7. Start sending true image data.
8. Enable backlight.

Power-down sequence (SN65LVDS301 RXEN input initially high):

1. Disable LCD backlight and wait for the minimum time specified in the LCD datasheet for the backlight to go low.
2. Switch the video source output from active video data to black image data (all visible pixels turn black) for at least 2 frame times.
3. Set SN65LVDS301 TXEN = GND and wait for 250 ns.
4. Set SN65LVDS302 RXEN = GND and wait for 250 ns.
5. Disable the video output of the video source.
6. Remove power from the LCD panel for lowest system power.

9.2.1.3 Application Curves

图 9-6. VGA 2-Channel Output Waveform

图 9-7. VGA 2-Channel Output Waveform

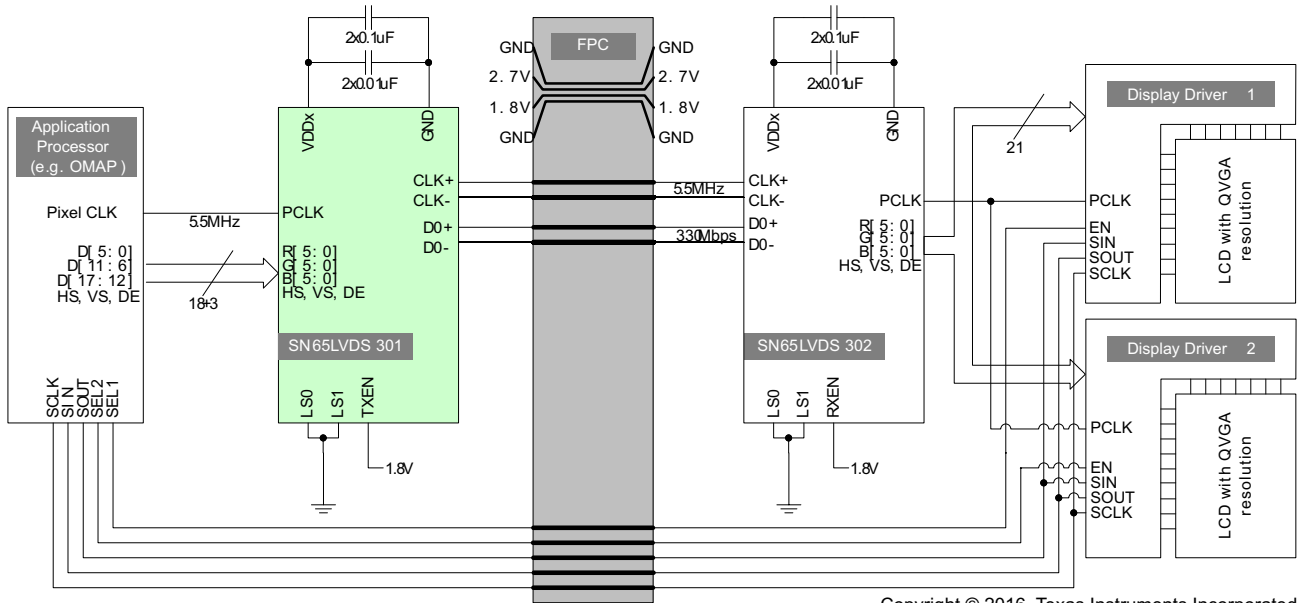

图 9-8. VGA3-Channel Output Waveform

9.2.2 Dual LCD-Display Application

The example in 图 9-9 shows a possible application setup driving two video-mode displays from one application processor. The data rate of 330 Mbps at a pixel clock rate of 5.5 MHz corresponds to a 320x240 QVGA resolution at 60 Hz refresh rate and 10% blanking overhead.

9.2.2.1 Design Requirements

For this design example, use the parameters listed in 表 9-3 as the input parameters.

表 9-3. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Operating free-air temperature range	- 40°C to 85°C
Supply voltages, V_{DD} , V_{DDLVDs} , V_{DDPLLA} , V_{DDPLLD}	1.65 V to 1.95 V
Magnitude of differential input voltage, V_{ID}	70 mV to 200 mV
Input voltage common mode range, V_{ICM}	0.6 V to 1.2 V

表 9-3. Design Parameters (continued)

DESIGN PARAMETER	EXAMPLE VALUE
Receiver input skew, 1-channel mode	< 630 ps

9.2.2.2 Application Curve

图 9-10. QVGA Output Waveform

10 Power Supply Recommendations

To minimize the power supply noise floor, provide good decoupling near the SN65LVDS302 power pins. TI recommends placing one 0.01- μ F ceramic capacitor at each power pin, and two 0.1- μ F ceramic capacitors on each power node. The distance between the SN65LVDS302 and capacitors must be minimized to reduce loop inductance and provide optimal noise filtering. Placing the capacitor underneath the SN65LVDS302 on the bottom of the PCB is often a good choice. A 100-pF ceramic capacitor can be put at each power pin to optimize the EMI performance.

11 Layout

11.1 Layout Guidelines

Use chamfered corners (45° bends) instead of right-angle (90°) bends. Right-angle bends increase the effective trace width, which changes the differential trace impedance creating large discontinuities. A 45° bend is seen as a smaller discontinuity.

When routing traces next to a via or between an array of vias, make sure that the via clearance section does not interrupt the path of the return current on the ground plane below.

Avoid metal layers and traces underneath or between the pads of the LVDS connectors for better impedance matching. Otherwise they cause the differential impedance to drop below 75 Ω and fail the board during TDR testing.

Use solid power and ground planes for 100 Ω impedance control and minimum power noise.

For a multilayer PCB, TI recommends keeping one common GND layer underneath the device and connect all ground terminals directly to this plane. For 100 Ω differential impedance, use the smallest trace spacing possible, which is usually specified by the PCB vendor.

Keep the trace length as short as possible to minimize attenuation.

Place bulk capacitors (10 μ F) close to power sources, such as voltage regulators or where the power is supplied to the PCB.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
SN65LVDS302ZXH	ACTIVE	NFBGA	ZXH	80	576	RoHS & Green	SNAGCU	Level-3-260C-168 HR	-40 to 85	LVDS302	Samples
SN65LVDS302ZXHR	ACTIVE	NFBGA	ZXH	80	2500	RoHS & Green	SNAGCU	Level-3-260C-168 HR	-40 to 85	LVDS302	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
