

## TLV703x-Q1 和 TLV704x-Q1 轨至轨低功耗比较器

### 1 特性

- 符合汽车应用要求
- 具有符合 AEC-Q100 标准的下列特性：
  - 器件温度等级 1：-40°C 至 125°C 环境温度范围
  - 器件 HBM ESD 分类等级 2
  - 器件 CDM ESD 分类等级 C5
- 1.6V 至 6.5V 的宽电源电压范围
- 315nA 静态电源电流
- 3μs 低传播延迟
- 6.5mV 的内部迟滞
- 轨到轨共模输入电压
- 内部上电复位提供已知启动条件
- 过驱动输入无相位反转
- 推挽输出 (TLV703x-Q1)
- 开漏输出 (TLV704x-Q1)
- 40°C 至 125°C 工作温度
- 提供功能安全
  - 可帮助进行功能安全系统设计的文档 (TLV70x1-Q1)
  - 可帮助进行功能安全系统设计的文档 (TLV70x2-Q1)

### 2 应用

- 远程信息处理 eCall
- 汽车音响主机
- 仪表组
- 音频放大器
- 车载充电器 (OBC) 和无线充电器

I<sub>CC</sub> 与 V<sub>CC</sub> 间的关系

### 3 说明

TLV703x-Q1/TLV704x-Q1 是具有轨至轨输入的低电压毫微功耗比较器。这两款比较器适用于空间关键型和功耗敏感型设计，如信息娱乐系统、远程信息处理和音响主机应用。

TLV703x-Q1 和 TLV704x-Q1 集出色的低功耗和高速度于一体。得益于毫微功耗下的快速响应优势，功耗敏感型系统能够监测故障状况并快速做出响应。这两款比较器的工作电压范围为 1.6V 至 6.5V，因此可与 1.8V、3V 和 5V 系统兼容。

TLV703x-Q1 和 TLV704x-Q1 还凭借过驱输入和内部迟滞来确保不会出现输出相位反转，因此工程师可以将此系列的比较器用在必须将慢速输入信号转换为纯净数字输出的严苛、嘈杂环境中进行精密电压监测。

TLV703x-Q1 具有推挽式输出级，能够灌/拉毫安级电流。TLV704x-Q1 具有可上拉到 V<sub>CC</sub> 之上的漏极开路输出级。

#### 器件信息

器件型号	封装 (引脚) <sup>(1)</sup>	封装尺寸 (标称值)
TLV7031-Q1、 TLV7041-Q1	SC70 (5)	2.00mm × 1.25mm
	SOT-23 (5)	2.90mm × 1.60mm
TLV7032-Q1、 TLV7042-Q1	VSSOP (8)	3.00mm × 3.00mm

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
Supply voltage $V_S = V_{CC} - V_{EE}$	- 0.3	7	V
Input pins (IN+, IN - ) <sup>(2)</sup>	$V_{EE} - 0.3$	7	V
Output (OUT) (push-pull) <sup>(3)</sup>	$V_{EE} - 0.3$	$V_{CC} + 0.3$	V
Output (OUT) (open-drain)	$V_{EE} - 0.3$	7	V
Output short-circuit duration <sup>(4)</sup>		10	s
Junction temperature, $T_J$		150	°C
Storage temperature, $T_{stg}$	- 65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Input terminals are diode-clamped to  $V_{EE}$ . Input signals that can swing 0.3V below  $V_{EE}$  must be current-limited to 10mA or less
- (3) Output maximum is ( $V_{CC} + 0.3$  V) or 7 V, whichever is less.
- (4) Short-circuit to ground, one comparator per package.

### 6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup>	±2000	V
		Charged-device model (CDM), per AEC Q100-011	±1000	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Supply voltage $V_S = V_{CC} - V_{EE}$	1.6	6.5	V
Input voltage range	$V_{EE} - 0.1$	$V_{CC} + 0.1$	V
Ambient temperature, $T_A$	- 40	125	°C

## 7 Detailed Description

### 7.1 Overview

The TLV703x-Q1 and TLV704x-Q1 devices are single-channel, nano-power comparators with push-pull and open-drain outputs. Operating from 1.6 V to 6.5 V and consuming only 315 nA, the TLV703x-Q1 and TLV704x-Q1 are designed for portable and industrial applications.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

The TLV703x-Q1 and TLV704x-Q1 comparators are nanopower comparators that are capable of operating at low voltages. The TLV703x-Q1 and TLV704x-Q1 feature a rail-to-rail input stage capable of operating up to 100 mV beyond the  $V_{CC}$  power supply rail. The TLV703x-Q1 (push-pull) and TLV704x-Q1 (open-drain) also feature internal hysteresis.

### 7.4 Device Functional Modes

The TLV703x-Q1 and TLV704x-Q1 have a power-on-reset (POR) circuit. While the power supply ( $V_S$ ) is less than the minimum supply voltage, either upon ramp-up or ramp-down, the POR circuitry is activated.

For the TLV703x-Q1, the POR circuit holds the output low (at  $V_{EE}$ ) while activated.

For the TLV704x-Q1, the POR circuit keeps the output high impedance (logical high) while activated.

When the supply voltage is greater than, or equal to, the minimum supply voltage, the comparator output reflects the state of the differential input ( $V_{ID}$ ).

### 7.4.1 Inputs

The TLV703x-Q1 and TLV704x-Q1 input common-mode extends from  $V_{EE}$  to 100 mV above  $V_{CC}$ . The differential input voltage ( $V_{ID}$ ) can be any voltage within these limits. No phase inversion of the comparator output occurs when the input pins exceed  $V_{CC}$  and  $V_{EE}$ .

The input of TLV703x-Q1 and TLV704x-Q1 is fault tolerant. It maintains the same high input impedance when  $V_{CC}$  is unpowered or ramping up. The input can be safely driven up to the specified maximum voltage (7 V) with  $V_{CC} = 0$  V or any value up to the maximum specified. The  $V_{CC}$  is isolated from the input such that it maintains its value even when a higher voltage is applied to the input.

The input bias current is typically 1 pA for input voltages between  $V_{CC}$  and  $V_{EE}$ . The comparator inputs are protected from voltages below  $V_{EE}$  by internal diodes connected to  $V_{EE}$ . As the input voltage goes under  $V_{EE}$ , the protection diodes become forward biased and begin to conduct causing the input bias current to increase exponentially. Input bias current typically doubles every 10°C temperature increases.

### 7.4.2 Internal Hysteresis

The device hysteresis transfer curve is shown in [图 7-1](#). This curve is a function of three components:  $V_{TH}$ ,  $V_{OS}$ , and  $V_{HYST}$ :

- $V_{TH}$  is the actual set voltage or threshold trip voltage.
- $V_{OS}$  is the internal offset voltage between  $V_{IN+}$  and  $V_{IN-}$ . This voltage is added to  $V_{TH}$  to form the actual trip point at which the comparator must respond to change output states.
- $V_{HYST}$  is the internal hysteresis (or trip window) that is designed to reduce comparator sensitivity to noise (7 mV for both TLV703x-Q1 and TLV704x-Q1).

**图 7-1. Hysteresis Transfer Curve**

### 7.4.3 Output

The TLV703x-Q1 features a push-pull output stage eliminating the need for an external pullup resistor. On the other hand, the TLV704x-Q1 features an open-drain output stage enabling the output logic levels to be pulled up to an external source up to 6.5 V independent of the supply voltage.

## 8 Application and Implementation

### 备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

### 8.1 Application Information

The TLV703x-Q1 and TLV704x-Q1 are nano-power comparators with reasonable response time. The comparators have a rail-to-rail input stage that can monitor signals beyond the positive supply rail with integrated hysteresis. When higher levels of hysteresis are required, positive feedback can be externally added. The push-pull output stage of the TLV703x-Q1 is optimal for reduced power budget applications and features no shoot-through current. When level shifting or wire-ORing of the comparator outputs is needed, the TLV704x-Q1 with its open-drain output stage is well suited to meet the system needs. In either case, the wide operating voltage range, low quiescent current, and small size of the TLV703x-Q1 and TLV704x-Q1 make these comparators excellent candidates for battery-operated and portable, handheld designs.

#### 8.1.1 Inverting Comparator With Hysteresis for TLV703x-Q1

The inverting comparator with hysteresis requires a three-resistor network that is referenced to the comparator supply voltage ( $V_{CC}$ ), as shown in [图 8-1](#). When  $V_{IN}$  at the inverting input is less than  $V_A$ , the output voltage is high (for simplicity, assume  $V_O$  switches as high as  $V_{CC}$ ). The three network resistors can be represented as  $R1 \parallel R3$  in series with  $R2$ . [方程式 1](#) defines the high-to-low trip voltage ( $V_{A1}$ ).

$$V_{A1} = V_{CC} \times \frac{R2}{(R1 \parallel R3) + R2} \quad (1)$$

When  $V_{IN}$  is greater than  $V_A$ , the output voltage is low, very close to ground. In this case, the three network resistors can be presented as  $R2 \parallel R3$  in series with  $R1$ . Use [方程式 2](#) to define the low to high trip voltage ( $V_{A2}$ ).

$$V_{A2} = V_{CC} \times \frac{R2 \parallel R3}{R1 + (R2 \parallel R3)} \quad (2)$$

[方程式 3](#) defines the total hysteresis provided by the network.

$$\Delta V_A = V_{A1} - V_{A2} \quad (3)$$

图 8-1. TLV703x-Q1 in an Inverting Configuration With Hysteresis

### 8.1.2 Noninverting Comparator With Hysteresis for TLV703x-Q1

A noninverting comparator with hysteresis requires a two-resistor network, as shown in 图 8-2, and a voltage reference ( $V_{REF}$ ) at the inverting input. When  $V_{IN}$  is low, the output is also low. For the output to switch from low to high,  $V_{IN}$  must rise to  $V_{IN1}$ . Use 方程式 4 to calculate  $V_{IN1}$ .

$$V_{IN1} = R1 \times \frac{V_{REF}}{R2} + V_{REF} \quad (4)$$

When  $V_{IN}$  is high, the output is also high. For the comparator to switch back to a low state,  $V_{IN}$  must drop to  $V_{IN2}$  such that  $V_A$  is equal to  $V_{REF}$ . Use 方程式 5 to calculate  $V_{IN2}$ .

$$V_{IN2} = \frac{V_{REF} (R1 + R2) - V_{CC} \times R1}{R2} \quad (5)$$

The hysteresis of this circuit is the difference between  $V_{IN1}$  and  $V_{IN2}$ , as shown in 方程式 6.

$$\Delta V_{IN} = V_{CC} \times \frac{R1}{R2} \quad (6)$$

## 8.2 Typical Applications

### 8.2.1 Window Comparator

Window comparators are commonly used to detect undervoltage and overvoltage conditions. [图 8-3](#) shows a simple window comparator circuit.

**图 8-3. TLV704x-Q1-Based Window Comparator**

#### 8.2.1.1 Design Requirements

For this design, follow these design requirements:

- Alert (logic low output) when an input signal is less than 1.1 V
- Alert (logic low output) when an input signal is greater than 2.2 V
- Alert signal is active low
- Operate from a 3.3-V power supply

#### 8.2.1.2 Detailed Design Procedure

Configure the circuit as shown in [图 8-3](#). Connect  $V_{CC}$  to a 3.3-V power supply and  $V_{EE}$  to ground. Make  $R_1$ ,  $R_2$ , and  $R_3$  each  $10\text{-M}\Omega$  resistors. These three resistors are used to create the positive and negative thresholds for the window comparator ( $V_{TH+}$  and  $V_{TH-}$ ). With each resistor being equal,  $V_{TH+}$  is 2.2 V and  $V_{TH-}$  is 1.1 V. Large resistor values such as  $10\text{ M}\Omega$  are used to minimize power consumption. The sensor output voltage is applied to the inverting and noninverting inputs of the two TLV704x-Q1 devices. The TLV704x-Q1 is used for its open-drain output configuration. Using the TLV704x-Q1 allows the two comparator outputs to be wire-ored together. The respective comparator outputs are low when the sensor is less than 1.1 V or greater than 2.2 V.  $V_{OUT}$  is high when the sensor is in the range of 1.1 V to 2.2 V.

### 8.2.2 IR Receiver Analog Front End

A single TLV703x-Q1 device can be used to build a complete IR receiver analog front end (AFE). The nanoamp quiescent current and low input bias current make it possible to be powered with a coin cell battery, which could last for years.

图 8-5. IR Receiver Analog Front End Using TLV703x-Q1

#### 8.2.2.1 Design Requirements

For this design, follow these design requirements:

- Use a proper resistor ( $R_1$ ) value to generate an adequate signal amplitude applied to the inverting input of the comparator.
- The low input bias current  $I_B$  (2 pA typical) ensures that a greater value of  $R_1$  to be used.
- The RC constant value ( $R_2$  and  $C_1$ ) must support the targeted data rate (that is, 9,600 bauds) in order to maintain a valid tripping threshold.
- The hysteresis introduced with  $R_3$  and  $R_4$  helps to avoid spurious output toggles.

### 8.2.2.2 Detailed Design Procedure

The IR receiver AFE design is highly streamlined and optimized.  $R_1$  converts the IR light energy induced current into voltage and applies to the inverting input of the comparator. The RC network of  $R_2$  and  $C_1$  establishes a reference voltage  $V_{ref}$ , which tracks the mean amplitude of the IR signal. The noninverting input is directly connected to  $V_{ref}$  through  $R_3$ .  $R_3$  and  $R_4$  are used to produce a hysteresis to keep transitions free of spurious toggles. To reduce the current drain from the coin cell battery, data transmission must be short and infrequent.

More technical details are provided in the TI TechNote [Low Power Comparator for Signal Processing and Wake-Up Circuit in Smart Meters](#) (SNVA808).

### 8.2.2.3 Application Curve

图 8-6. IR Receiver AFE Waveforms

### 8.2.3 Square-Wave Oscillator

A square-wave oscillator can be used as low-cost timing reference or system supervisory clock source.

图 8-7. Square-Wave Oscillator

#### 8.2.3.1 Design Requirements

The square-wave period is determined by the RC time constant of the capacitor and resistor. The maximum frequency is limited by the propagation delay of the device and the capacitance load at the output. The low input bias current allows a lower capacitor value and larger resistor value combination for a given oscillator frequency, which may help reduce BOM cost and board space.

#### 8.2.3.2 Detailed Design Procedure

The oscillation frequency is determined by the resistor and capacitor values. The following section provides details to calculate these component values.

图 8-8. Square-Wave Oscillator Timing Thresholds

First consider the output of figure 图 8-7 is high, which indicates the inverted input  $V_C$  is lower than the noninverting input ( $V_A$ ). This causes the  $C_1$  to be charged through  $R_4$ , and the voltage  $V_C$  increases until it is equal to the noninverting input. The value of  $V_A$  at the point is calculated by 方程式 7.

$$V_{A1} = \frac{V_{CC} \times R_2}{R_2 + R_1 + R_3} \quad (7)$$

If  $R_1 = R_2 = R_3$ , then  $V_{A1} = 2 V_{CC} / 3$

At this time the comparator output trips pulling down the output to the negative rail. The value of  $V_A$  at this point is calculated by 方程式 8.

$$V_{A2} = \frac{V_{CC}(R_2 \parallel R_3)}{R_1 + R_2 \parallel R_3} \quad (8)$$

If  $R_1 = R_2 = R_3$ , then  $V_{A2} = V_{CC}/3$

The  $C_1$  now discharges through the  $R_4$ , and the voltage  $V_{CC}$  decreases until it reaches  $V_{A2}$ . At this point, the output switches back to the starting state. The oscillation period equals the time duration from  $2 V_{CC} / 3$  to  $V_{CC} / 3$  then back to  $2 V_{CC} / 3$ , which is given by  $R_4 C_1 \times \ln 2$  for each trip. Therefore, the total time duration is calculated as  $2 R_4 C_1 \times \ln 2$ . The oscillation frequency can be obtained by 方程式 9:

$$f = 1 / (2 R_4 \times C_1 \times \ln 2) \quad (9)$$

### 8.2.3.3 Application Curve

图 8-9 shows the simulated results of an oscillator using the following component values:

- $R_1 = R_2 = R_3 = R_4 = 100 \text{ k}\Omega$
- $C_1 = 100 \text{ pF}$ ,  $C_L = 20 \text{ pF}$
- $V_+ = 5 \text{ V}$ ,  $V_- = \text{GND}$
- $C_{\text{stray}}$  (not shown) from  $V_A$  to GND =  $10 \text{ pF}$

图 8-9. Square-Wave Oscillator Output Waveform

## 9 Power Supply Recommendations

The TLV703x-Q1 and TLV704x-Q1 have a recommended operating voltage range ( $V_S$ ) of 1.6 V to 6.5 V.  $V_S$  is defined as  $V_{CC} - V_{EE}$ . Therefore, the supply voltages used to create  $V_S$  can be single-ended or bipolar. For example, single-ended supply voltages of 5 V and 0 V and bipolar supply voltages of +2.5 V and -2.5 V create comparable operating voltages for  $V_S$ . However, when bipolar supply voltages are used, it is important to realize that the logic low level of the comparator output is referenced to  $V_{EE}$ .

Output capacitive loading and output toggle rate will cause the average supply current to rise over the quiescent current.

## 10 Layout

### 10.1 Layout Guidelines

图 10-1 shows the typical connections for the TLV7031-Q1. To minimize supply noise, power supplies must be capacitively decoupled by a 0.1- $\mu$ F ceramic capacitor in parallel with a 10- $\mu$ F electrolytic capacitor. Comparators are very sensitive to input noise. Proper grounding (the use of a ground plane) helps to maintain the specified performance of the TLV70x1-Q1 family.

For best results, maintain the following layout guidelines:

1. Use a printed-circuit board (PCB) with a good, unbroken low-inductance ground plane.
2. Place a decoupling capacitor (0.1- $\mu$ F ceramic, surface-mount capacitor) as close as possible to  $V_{CC}$ .
3. On the inputs and the output, keep lead lengths as short as possible to avoid unwanted parasitic feedback around the comparator. Keep inputs away from the output.
4. Solder the device directly to the PCB rather than using a socket.
5. For slow-moving input signals, take care to prevent parasitic feedback. A small capacitor (1000 pF or less) placed between the inputs can help eliminate oscillations in the transition region. This capacitor causes some degradation to propagation delay when the impedance is low. The top-side ground plane runs between the output and inputs.
6. The ground pin ground trace runs under the device up to the bypass capacitor, shielding the inputs from the outputs.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
