

TPS2291xx 具有受控接通功能的超小型、低导通电阻负载开关

1 特性

- 集成单负载开关
- 四引脚晶圆级芯片规模封装（标称尺寸）
 - 0.9mm × 0.9mm, 0.5mm 间距, 0.5mm 高度 (YZV)
- 输入电压范围: 1.4V 至 5.5V
- 低导通电阻
 - 在 $V_{IN} = 5V$ 时, $r_{\text{导通}} = 60m\Omega$
 - 在 $V_{IN} = 3.3V$ 时, $r_{\text{导通}} = 61m\Omega$
 - 在 $V_{IN} = 1.8V$ 时, $r_{\text{导通}} = 74m\Omega$
 - 在 $V_{IN} = 1.5V$ 时, $r_{\text{导通}} = 84m\Omega$
- 2A 最大持续开关电流
- 低阈值控制输入
- 受控转换率
- 欠压闭锁
- 全时反向电流保护
- 快速输出放电晶体管 (TPS22913B/C 器件)

2 应用范围

- 笔记本电脑和 超极本™
- 平板电脑和机顶盒
- 便携式工业/医疗设备
- 便携式媒体播放器
- 销售点终端
- 全球卫星定位系统 (GPS) 导航器件
- 数码摄像机
- 便携式仪表
- 智能电话 / 无线手持终端

3 说明

TPS22910A、TPS22912C 和 TPS22913B/C 均为具有受控接通功能的小型、低 r_{ON} 负载开关。此器件包括一个 P 通道金属氧化物半导体场效应晶体管 (MOSFET)，可在 1.4V 至 5.5V 的输入电压范围内运行。此开关由一个开/关输入 (ON) 控制，该输入能够与低压通用输入输出 (GPIO) 控制信号直接对接。

TPS22910A、TPS22912C 和 TPS22913B/C 器件在接通和关断状态下均能提供反向电流保护。当输出电压 ($V_{\text{输出}}$) 被 V_{RCP} 驱动至高于输入电压 ($V_{\text{输入}}$) 时，内部反向电压比较器将禁用此电源开关以快速（典型值为 10 μs ）停止流向此开关输入端的电流。反向电流保护一直有效，即便当电源开关被禁用时也是如此。此外，如果此输入电压过低，欠压闭锁 (UVLO) 保护会将此开关关闭。

TPS22913B/C 包含一个 150 Ω 片上负载电阻器，用于在此开关被关闭时进行快速输出放电。

此系列器件提供了多种转换率选项以避免浪涌电流问题（详细信息请参见 [Device Comparison Table](#)），并且采用超小型、节省空间的 4 引脚晶圆级芯片规模封装 (WCSP) 封装，自然通风环境下的额定运行温度范围为 -40°C 至 85°C。

10 Detailed Description

10.1 Overview

This family of devices are single channel, 2-A load switches in ultra-small, space saving 4-pin WCSP package. These devices implement a low resistance P-channel MOSFET with a controlled rise time for applications that need to limit the inrush current.

These devices are designed to have very low leakage current during off state. This prevents downstream circuits from pulling high standby current from the supply. Integrated control logic, driver, power supply, and output discharge FET eliminates the need for additional external components, which reduces solution size and BOM count.

10.2 Functional Block Diagram

10.3 Feature Description

10.3.1 On/Off Control

The ON pin controls the state of the switch. The ON pin is compatible with standard GPIO logic threshold. It can be used with any microcontroller with 1.2-V, 1.8-V, 2.5-V, 3.3-V, or 5.5-V GPIO.

10.3.2 Under-Voltage Lockout

Under-voltage lockout protection turns off the switch if the input voltage drops below the under-voltage lockout threshold (UVLO). With the ON pin active, the input voltage rising above the under-voltage lockout threshold will cause a controlled turn-on of the switch to limit current over-shoot.

Feature Description (continued)

10.3.3 Full-Time Reverse Current Protection

In a scenario where V_{OUT} is greater than V_{IN} , there is potential for reverse current to flow through the pass FET or the body diode. The devices monitor V_{IN} and V_{OUT} voltage levels. When the reverse current voltage threshold (V_{RCP}) is exceeded, the switch is disabled (within 10 μ s typ). Additionally, the body diode is disengaged so as to prevent any reverse current flow to V_{IN} . The peak instantaneous reverse current is the current it takes to activate the reverse current protection. After the reverse current protection has activated due to the peak instantaneous reverse current, the DC (off-state) leakage current from V_{OUT} and V_{IN} is referred to as $I_{RCP(leak)}$ (see Figure 49). The pass FET, and the output voltage (V_{OUT}), will resume normal operation when the reverse voltage scenario is no longer present.

The following formula can be used to calculate the amount of peak instantaneous reverse current for a particular application:

$$I_{RC} = \frac{V_{RCP}}{r_{ON(VIN)}}$$

Where,

I_{RC} is the amount of reverse current,

$r_{ON(VIN)}$ is the on-resistance at the V_{IN} of the reverse current condition.

V_{RCP} is the reverse voltage threshold.

Figure 49. Reverse Current

10.4 Device Functional Modes

Table 2 describes what the V_{OUT} pin will be connected to for a particular device as determined by the ON pin

Table 2. V_{OUT} Function Table

ON	TPS22910A	TPS22912C	TPS22913B/C
L	VIN	Open	GND
H	Open	VIN	VIN

11 Application and Implementation

11.1 Application Information

This section will highlight some of the design considerations when implementing this device in various applications. A PSPICE model for this device is also available in the product page of this device on www.ti.com for further aid.

11.1.1 VIN to VOUT Voltage Drop

The VIN to VOUT voltage drop in the device is determined by the R_{ON} of the device and the load current. The R_{ON} of the device depends upon the VIN condition of the device. Refer to the R_{ON} specification of the device in the Electrical Characteristics table of this datasheet. Once the R_{ON} of the device is determined based upon the VIN conditions, use [Equation 1](#) to calculate the VIN to VOUT voltage drop:

$$\Delta V = I_{LOAD} \times R_{ON} \quad (1)$$

Where,

ΔV = Voltage drop from VIN to VOUT

I_{LOAD} = Load current

R_{ON} = On-resistance of the device for a specific V_{IN}

An appropriate I_{LOAD} must be chosen such that the I_{MAX} specification of the device is not violated.

11.1.2 On/Off Control

The ON pin controls the state of the switch. The ON pin has a low threshold, making it capable of interfacing with low-voltage signals. The ON pin is compatible with standard GPIO logic thresholds. It can be used with any microcontroller with 1.2 V or higher GPIO voltage. This pin cannot be left floating and must be driven either high or low for proper functionality.

11.1.3 Input Capacitor (Optional)

To limit the voltage drop on the input supply caused by transient inrush currents when the switch turns on into a discharged load capacitor or short-circuit, a capacitor needs to be placed between V_{IN} and GND. A 1- μ F ceramic capacitor, C_{IN} , placed close to the pins, is usually sufficient. Higher values of C_{IN} can be used to further reduce the voltage drop during high current applications. When switching heavy loads, it is recommended to have an input capacitor about 10 times higher than the output capacitor to avoid excessive voltage drop.

11.1.4 Output Capacitor (Optional)

Due to the integrated body diode in the PMOS switch, a C_{IN} greater than C_L is highly recommended. A C_L greater than C_{IN} can cause V_{OUT} to exceed V_{IN} when the system supply is removed. This could result in current flow through the body diode from V_{OUT} to V_{IN} . A C_{IN} to C_L ratio of 10 to 1 is recommended for minimizing VIN dip caused by inrush currents during startup, however a 10 to 1 ratio for capacitance is not required for proper functionality of the device. A ratio smaller than 10 to 1 (such as 1 to 1) could cause slightly more V_{IN} dip upon turn-on due to inrush currents. This can be mitigated by using a device with a longer rise time.

11.2 Typical Application

Figure 50. Typical Application

Typical Application (continued)

11.2.1 Design Requirements

Design Parameter	Example Value
VIN	1.5 V to 5 V
CL	0.1 μF to 1 μF
Maximum Acceptable Inrush Current	1 A

11.2.2 Detailed Design Procedure

11.2.2.1 Inrush Current

When the switch is enabled, the output capacitors must be charged up from 0-V to VIN voltage. This charge arrives in the form of inrush current. Inrush current can be calculated using the following equation:

$$\text{Inrush Current} = C \times \frac{dv}{dt} \quad (2)$$

Where,

C = Output capacitance

$\frac{dv}{dt}$ = Output slew rate

The TPS22910A, TPS22912C, and TPS22913B/C offer several different rise time options to control the inrush current during turn-on. The appropriate device can be selected based upon the maximum acceptable slew rate which can be calculated using the design requirements and the inrush current equation. An output capacitance of 1.0 μF will be used since the inrush follows the following equations:

$$1.0 \text{ A} = 1.0 \text{ } \mu\text{F} \times \frac{dv}{dt} \quad (3)$$

$$\frac{dv}{dt} = 1 \text{ V}/\mu\text{s} \quad (4)$$

To ensure an inrush current of less than 1 A, a device with a slew rate less than 1 V/μs must be used

The TPS22910A has a typical rise time of 1 μs at 3.3 V. This results in a slew rate of 3.3 V/μs which is above the 1 V/μs requirement meaning the TPS22910 could not be used to meet the design requirements.

The TPS22913B has a typical rise time of 66 μs at 3.3 V. This results in a slew rate of 50 mV/μs which is below the 1 V/μs requirement; therefore, the TPS22913B could be used to meet the design requirements. The TPS22912C or TPS22913C have lower slew rates than the TPS22913B, so they could also be used, but the output would rise more slowly.

11.2.3 Application Curves

11.2.3.1 Typical Application Characteristics for TPS22910A

The dark blue curve (Channel 1) represents the VOUT pin of the device. The light blue curve (Channel 2) represents the ON pin of the device.

12 Power Supply Recommendations

The device is designed to operate with a V_{IN} range of 1.4 V to 5.5 V.

13 Layout

13.1 Layout Guidelines

For best performance, all traces should be as short as possible. To be most effective, the input and output capacitors should be placed close to the device to minimize the effects that parasitic trace inductances may have on normal operation. Using wide traces for V_{IN} , V_{OUT} , and GND helps minimize the parasitic electrical effects along with minimizing the case to ambient thermal impedance.

13.2 Layout Example

The figure below shows an example for these devices. Notice the connection to system ground between the V_{OUT} Bypass Capacitor ground and the GND pin of the load switch, this creates a ground barrier which helps to reduce the ground noise seen by the device.

13.3 Thermal Considerations

The maximum IC junction temperature should be restricted to 125°C under normal operating conditions. To calculate the maximum allowable dissipation, $P_{D(max)}$ for a given output current and ambient temperature, use the following equation as a guideline:

$$P_{D(max)} = \frac{T_{J(max)} - T_A}{R_{\theta JA}} \quad (5)$$

where

- $P_{D(max)}$ = maximum allowable power dissipation
- $T_{J(max)}$ = maximum allowable junction temperature
- T_A = ambient temperature of the device
- θ_{JA} = junction to air thermal impedance. See the [Thermal Information](#) section. This parameter is highly dependent upon board layout.

14 器件和文档支持

14.1 相关链接

下面的表格列出了快速访问链接。范围包括技术文档、支持和社区资源、工具和软件，以及样片或购买的快速访问。

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
