

## TPS22924x 3.6V、2A、导通电阻为 18.3mΩ 的负载开关

### 1 特性

- 集成单负载开关
- 输入电压：0.75V 至 3.6V
- 导通电阻
  - $V_{IN} = 3.6V$  时,  $R_{ON} = 18.3m\Omega$
  - $V_{IN} = 1.8V$  时,  $R_{ON} = 19.6m\Omega$
  - $V_{IN} = 1.2V$  时,  $R_{ON} = 19.4m\Omega$
  - $V_{IN} = 0.75V$  时,  $R_{ON} = 22.7m\Omega$
- 小型芯片比例 (CSP)-6 封装  
0.9mm x 1.4mm、0.5mm 间距
- 2A 最大持续开关电流
- 低关断电流
- 低阈值控制输入
- 受控转换率以避免涌入电流
- 快速输出放电晶体管
- 静电放电 (ESD) 性能测试符合 JESD 22 标准
  - 5000V 人体放电模式 (A114-B, II 类)
  - 1000V 组件充电模式 (C101)

### 2 应用

- 电池供电类设备
- 便携式工业设备
- 便携式医疗设备
- 便携式媒体播放器
- 销售点终端
- 全球卫星定位 (GPS) 设备
- 数码摄像机
- 笔记本/平板电脑/电子阅读器
- 智能手机

### 3 说明

TPS22924x 是一款具有受控接通功能的小型、低  $R_{ON}$  的负载开关。此器件包含一个 N 通道 MOSFET，此 MOSFET 可运行在 0.75V 至 3.6V 的输入电压范围内。一个集成的电荷泵把 NMOS 开关偏置，以实现一个最小的开关导通电阻。此开关可由一个打开/关闭输入 (ON) 控制，此输入可与低压控制信号直接对接。

为能够在开关关闭时快速进行输出放电，添加了一个 1250Ω 的片上负载电阻。此器件的上升时间受到内部控制以避免出现浪涌电流。TPS22924B 在  $V_{IN} = 3.6V$  时的上升时间为 100μs，而 TPS22924C 在  $V_{IN} = 3.6V$  时的上升时间为 800μs。

TPS22924x 采用超小型、节省空间的 6 引脚 CSP 封装，并可在 -40°C 至 85°C 温度范围内的自然通风条件下运行。

- (1) Package drawings, thermal data, and symbolization are available at [www.ti.com/packaging](http://www.ti.com/packaging).
- (2) The actual top-side marking has three preceding characters to denote year, month, and sequence code, and one following character to designate the wafer fab/assembly site. Pin 1 identifier indicates solder-bump composition (1 = SnPb, • = Pb-free).
- (3) CSP (DSBGA) devices manufactured with backside coating have an increased resistance to cracking due to the increased physical strength of the package. Devices with backside coating are highly encouraged for new designs.

## 9 Detailed Description

### 9.1 Overview

The TPS22924x is a single channel, 2-A load switch in a small, space-saving CSP-6 package. This device implements a low resistance N-channel MOSFET with a controlled rise time for applications that need to limit the inrush current.

This device is also designed to have very low leakage current during off state. This prevents downstream circuits from pulling high standby current from the supply. Integrated control logic, driver, power supply, and output discharge FET eliminates the need for additional external components, which reduces solution size and bill of materials (BOM) count.

### 9.2 Functional Block Diagram

### 9.3 Feature Description

#### 9.3.1 ON/OFF Control

The ON pin controls the state of the switch. Asserting ON high enables the switch. ON is active high and has a low threshold, making it capable of interfacing with low-voltage signals. The ON pin is compatible with standard GPIO logic threshold. It can be used with any microcontroller with 1.2-V, 1.8-V, 2.5-V or 3.3-V GPIOs.

#### 9.3.2 Output Capacitor

Due to the integral body diode in the NMOS switch, a  $C_{IN}$  greater than  $C_L$  is highly recommended. A  $C_L$  greater than  $C_{IN}$  can cause  $V_{OUT}$  to exceed  $V_{IN}$  when the system supply is removed. This could result in current flow through the body diode from  $V_{OUT}$  to  $V_{IN}$ . A  $C_{IN}$  to  $C_L$  ratio of 10 to 1 is recommended for minimizing  $V_{IN}$  dip caused by inrush currents during startup.

#### 9.3.3 Output Pulldown

The output pulldown is active when the user is turning off the main pass FET. The pulldown discharges the output rail to approximately 10% of the rail, then the output pulldown is automatically disconnected to optimize the shutdown current.

## 10 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 10.1 Application Information

#### 10.1.1 VIN to VOUT Voltage Drop

The VIN to VOUT voltage drop in the device is determined by the  $R_{ON}$  of the device and the load current. The  $R_{ON}$  of the device depends upon the VIN condition of the device. Refer to the  $R_{ON}$  specification of the device in the Electrical Characteristics table of this datasheet. Once the  $R_{ON}$  of the device is determined based upon the VIN conditions, use [Equation 1](#) to calculate the VIN to VOUT voltage drop:

$$\Delta V = I_{LOAD} \times R_{ON}$$

where

- $\Delta V$  = Voltage drop from VIN to VOUT
- $I_{LOAD}$  = Load current
- $R_{ON}$  = On-resistance of the device for a specific VIN
- An appropriate  $I_{LOAD}$  must be chosen such that the  $I_{MAX}$  specification of the device is not violated. (1)

#### 10.1.2 Input Capacitor

To limit the voltage drop on the input supply caused by transient inrush currents, when the switch turns on into a discharged load capacitor or short-circuit, a capacitor needs to be placed between VIN and GND. A 1- $\mu$ F ceramic capacitor,  $C_{IN}$ , placed close to the pins is usually sufficient. Higher values of  $C_{IN}$  can be used to further reduce the voltage drop.

#### 10.1.3 Output Capacitor

A  $C_{IN}$  to  $C_L$  ratio of 10 to 1 is recommended for minimizing VIN dip caused by inrush currents during startup.

### 10.2 Typical Application

#### 10.2.1 Design Requirements

DESIGN PARAMETER	EXAMPLE VALUE
VIN	3.6 V
CL	1 $\mu$ F
Maximum Acceptable Inrush Current	40 mA

## 10.2.2 Detailed Design Procedure

### 10.2.2.1 Managing Inrush Current

When the switch is enabled, the output capacitors must be charged up from 0-V to  $V_{IN}$ . This charge arrives in the form of inrush current. Inrush current can be calculated using the following equation:

$$\text{Inrush Current} = C \times \frac{dv}{dt}$$

where

- $C$  = Output capacitance
  - $\frac{dv}{dt}$  = Output slew rate
- (2)

The TPS22924B offers a very slow controlled rise time for minimizing inrush current. This device can be selected based upon the maximum acceptable slew rate which can be calculated using the design requirements and the inrush current equation. An output capacitance of  $1.0 \mu\text{F}$  will be used since the amount of inrush increases with output capacitance:

$$40 \text{ mA} = 1.0 \mu\text{F} \times \frac{dv}{dt} \tag{3}$$

$$\frac{dv}{dt} = 40 \text{ V/ms} \tag{4}$$

To ensure an inrush current of less than 40 mA, a device with a slew rate less than 40 V/ms must be used.

The TPS22924B has a typical rise time of  $96 \mu\text{s}$  at 3.6 V. This results in a slew rate of 37.5 V/ms which meets the above design requirements. For an even lower inrush current requirement, the TPS22924C can be used. The slower rise time of  $800 \mu\text{s}$  at 3.6V results in a slew rate of 4.5 V/ms, well below the design requirements.

### 10.2.3 Application Curve

## 11 Power Supply Recommendations

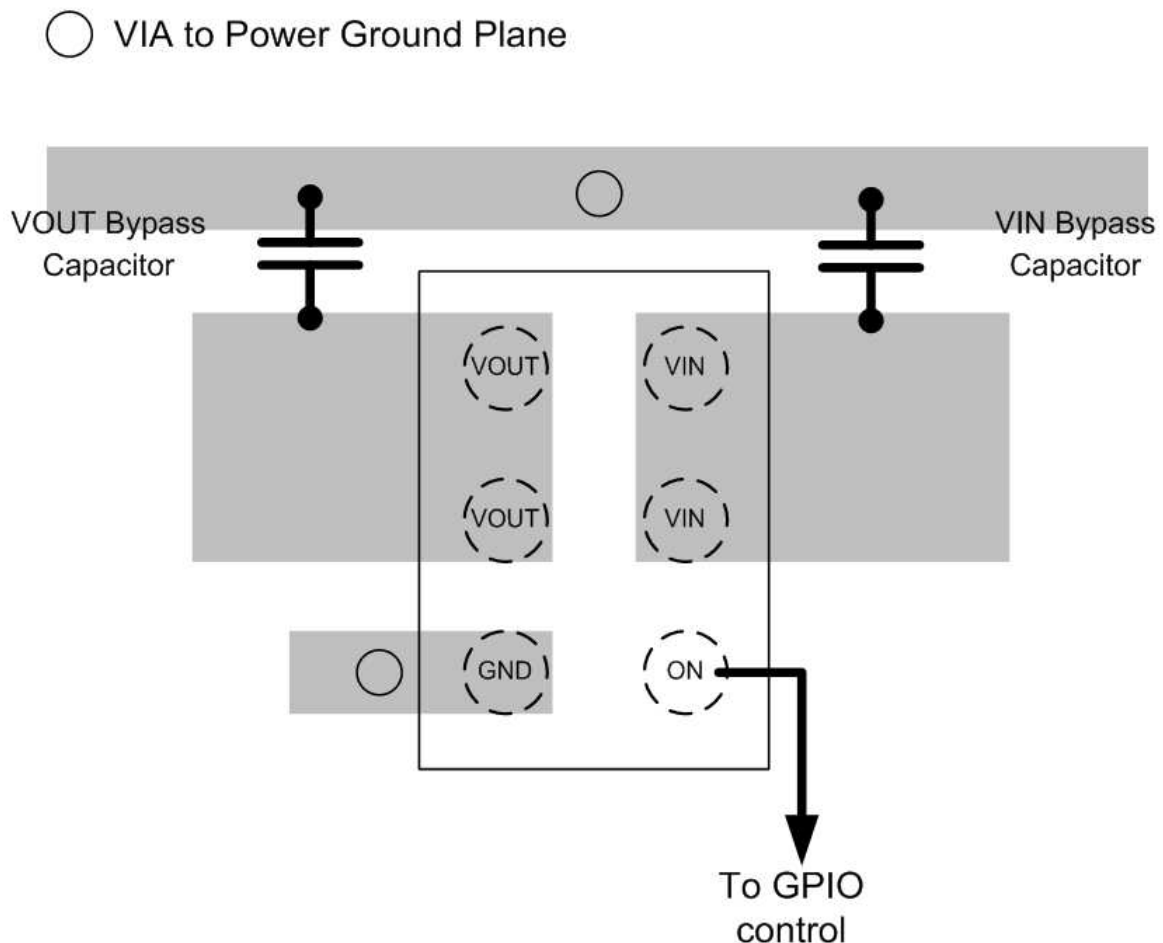

The device is designed to operate with a  $V_{IN}$  range of 0.75 V to 3.6 V. This supply must be well regulated and placed as close to the device terminal as possible with the recommended 1  $\mu\text{F}$  bypass capacitor. If the supply is located more than a few inches from the device terminals, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. If additional bulk capacitance is required, an electrolytic, tantalum, or ceramic capacitor of 10  $\mu\text{F}$  may be sufficient.

## 12 Layout

### 12.1 Layout Guidelines

For best performance, all traces should be as short as possible. To be most effective, the input and output capacitors should be placed close to the device to minimize the effects that parasitic trace inductances may have on normal and short-circuit operation. Using wide traces for  $V_{IN}$ ,  $V_{OUT}$ , and GND helps minimize the parasitic electrical effects.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
