

## UA78L 系列正电压线性稳压器

### 1 特性

- 输入电压范围 ( $V_I$ ) : 4.75 V 至 35 V
- 输出电压范围 ( $V_O$ ) :
  - 2.6V 至 15V (适用于旧芯片)
  - 3.3V 至 15V (适用于新芯片)
- 输出电流 : 高达 100 mA
- 静态电流  $I_Q$  : 3.8 mA
- 内置短路电流限制和热保护
- 无需任何外部元件即可保持稳定
- 支持的温度范围 :
  - 旧芯片 C 和 AC 版本 : 0°C 至 +125°C
  - 旧芯片 AI 版本 : -40°C 至 +125°C
  - 新芯片 : -40°C 至 +125°C
- 封装 :
  - 8 引脚 , 4.9mm x 3.91mm SOIC
  - 3 引脚 , 4.3mm x 4.3mm TO-92
  - 3 引脚 , 4.5mm x 2.5mm SOT-89

### 2 应用

- 电机驱动器
- 电器
- 楼宇自动化
- 流量变送器
- 工厂自动化和控制

### 3 说明

UA78L 系列固定电压线性稳压器适用于各种应用。UA78L 系列可用于板级稳压，从而消除与单点稳压相关的噪声和分布问题。UA78L 也可与功率导通元件配合使用，用作高电流电压稳压器。UA78L 系列稳压器可提供高达 100mA 的输出电流。此外，UA78L 无需外部电容器即可在整个负载电流范围内稳定运行。这类稳压器的内部电流限制和热关断功能可避免器件发生过载。

对于旧芯片，UA78L00C 和 UA78L00AC 系列的额定结温范围为 0°C 至 +125°C，UA78L05AI 器件的额定工作结温范围为 -40°C 至 +125°C。

对于新芯片，UA78L 系列的额定结温范围为 -40°C 至 +125°C。

#### 封装信息

| 器件型号  | 封装 <sup>(1)</sup> | 封装尺寸 <sup>(2)</sup> |
|-------|-------------------|---------------------|
| UA78L | D ( SOIC , 8 )    | 4.9 mm × 6 mm       |
|       | LP ( TO-92 , 3 )  | 5.2 mm × 3.68 mm    |
|       | PK ( SOT-89 , 3 ) | 4.5 mm × 4.095 mm   |

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

(2) 封装尺寸 (长 × 宽) 为标称值，并包括引脚 (如适用)。

简化原理图

|                          |          |
|--------------------------|----------|
| • 将 M3 器件状态从预告信息 更改为量产数据 | <b>1</b> |
|--------------------------|----------|

### Changes from Revision V (November 2016) to Revision W (April 2023) Page

|   |           |
|---|-----------|
| • 向文档添加了 M3 器件  | <b>1</b>  |
| • 更改了特性、应用和说明部分   | <b>1</b>  |
| • Changed <i>Description</i> column of <i>Pin Functions</i> table   | <b>3</b>  |
| • Added plots for new chip, reordered plots for legacy chip, and changed condition statement in <i>Typical Characteristics</i> section  | <b>13</b> |
| • Changed <i>Overview</i> section   | <b>17</b> |
| • Changed <i>Feature Description</i> section and added subsections  | <b>17</b> |
| • Changed <i>Device Functional Modes</i> section: added <i>Device Functional Mode Comparison</i> table, deleted <i>Fixed-Output Mode</i> subsection, and added <i>Normal Operation</i> and <i>Dropout Operation</i> subsections | <b>19</b> |
| • Changed <i>Detailed Design Procedure</i> section and added subsections  | <b>20</b> |
| • Added plots for new chip and changed condition statement in <i>Application Curves</i> section   | <b>24</b> |
| • Added <i>Device Nomenclature</i> and <i>Evaluation Module</i> sections  | <b>27</b> |

## 5 Pin Configuration and Functions

图 5-1. D Package, 8-Pin SOIC (Top View)

图 5-2. LP Package, 3-Pin TO-92 (Top View)

图 5-3. PK Package, 3-Pin SOT-89 (Top View)

| PIN    |            |       |        | TYPE | DESCRIPTION   |
|--------|------------|-------|--------|------|---|
| NAME   | SOIC       | TO-92 | SOT-89 |      |   |
| COMMON | 2, 3, 6, 7 | 2     | 2      | —    | Ground  |
| INPUT  | 8          | 3     | 3      | I    | Input pin. Use the recommended capacitor value as listed in the <a href="#">Recommended Operating Conditions</a> table. Place the input capacitor as close to the IN and GND pins of the device as possible.    |
| OUTPUT | 1          | 1     | 1      | O    | Output pin. Use the recommended capacitor value as listed in the <a href="#">Recommended Operating Conditions</a> table. Place the output capacitor as close to the OUT and GND pins of the device as possible. |
| NC     | 4, 5       | —     | —      | —    | No connect pin. This pin is not connected internally. Connect this pin to ground for best thermal performance or leave floating.  |

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating temperature range (unless otherwise noted)<sup>(1)</sup>

|  |  | MIN  | MAX | UNIT |
|--|--|------|-----|------|
| Input voltage, $V_I$ (for legacy chip) | UA78L02AC, UA78L05C, UA78L09C, and UA78L10AC                       |      | 30  | V    |
|  | UA78L12C, UA78L12AC, UA78L15C, and UA78L15AC                       |      | 35  |      |
| Input voltage, $V_I$ (for new chip)    | UA78L33AI, UA78L05AC, UA78L05AI, UA78L05C, UA78L12AC and UA78L15AC |      | 45  |      |
| Junction temperature, $T_J$            |  |      | 150 | °C   |
| Storage temperature, $T_{stg}$         |  | - 65 | 150 | °C   |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

|             |                         | VALUE (Legacy Chip)  | VALUE (New Chip) | UNIT |
|-------------|-------------------------|--|------------------|------|
| $V_{(ESD)}$ | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>              | 1000             | V    |
|             |                         | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup> | 1000             |      |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

|                          |                                 | MIN   | TYP  | MAX  | UNIT    |
|--------------------------|---------------------------------|---|------|------|---------|
| $V_I$                    | Input voltage                   | UA78L02AC (for legacy chip only)                          | 4.75 | 20   | V       |
|                          |                                 | UA78L033AC (for new chip only)                            | 4.75 | 20   |         |
|                          |                                 | UA78L05C and UA78L05AC (for both legacy and new chip)     | 7    | 20   |         |
|                          |                                 | UA78L06C and UA78L06AC (for legacy chip only)             | 8.5  | 20   |         |
|                          |                                 | UA78L08C and UA78L08AC (for legacy chip only)             | 10.5 | 23   |         |
|                          |                                 | UA78L09C and UA78L09AC (for legacy chip only)             | 11.5 | 24   |         |
|                          |                                 | UA78L10AC (for legacy chip only)                          | 12.5 | 25   |         |
|                          |                                 | UA78L12C and UA78L12AC (for both legacy and new chip)     | 14.5 | 27   |         |
|                          |                                 | UA78L15C and UA78L15AC (for both legacy and new chip)     | 17.5 | 30   |         |
| $I_O$                    | Output current                  |   |      | 100  | mA      |
| $C_{IN}$ <sup>(2)</sup>  | Input capacitor <sup>(3)</sup>  |   |      | 0.33 | $\mu F$ |
| $C_{OUT}$ <sup>(2)</sup> | Output capacitor <sup>(4)</sup> |   |      | 0.1  |         |
| $T_J$                    | Operating junction temperature  | UA78L00C and UA78L00AC series (for legacy chip)           | 0    | 125  | °C      |
|                          |                                 | UA78L05AI (for legacy chip)                               | - 40 | 125  |         |
|                          |                                 | UA78L00C , UA78L00AC, and UA78L05AI series (for new chip) | - 40 | 125  |         |

- (1) All voltages are with respect to GND.  
 (2) UA78L regulator doesn't need any external capacitors for the the LDO stability.  
 (3) An input capacitor with value of 0.33  $\mu F$  is recommended to counteract the effect of source resistance and inductance, which can in some cases cause symptoms of system level instability such as ringing or oscillation, especially in the presence of load transients.

- (4) An output capacitor with value of  $0.1 \mu\text{F}$  is recommended to improve the load and line transient performance of the UA78L regulator.

## 6.4 Thermal Information

| THERMAL METRIC <sup>(1)</sup> |  | UA78L00  |            |             | UNIT |
|-------------------------------|--|----------|------------|-------------|------|
|                               |  | D (SOIC) | LP (TO-92) | PK (SOT-89) |      |
|                               |  | 8 PINS   | 3 PINS     | 3 PINS      |      |
| $R_{\theta JA}$               | Junction-to-ambient thermal resistance       | 115      | 143.6      | 54.7        | °C/W |
| $R_{\theta JC(\text{top})}$   | Junction-to-case (top) thermal resistance    | 60.3     | 74.4       | 88.1        | °C/W |
| $R_{\theta JB}$               | Junction-to-board thermal resistance         | 55.6     | —          | 9.6         | °C/W |
| $\psi_{JT}$                   | Junction-to-top characterization parameter   | 16.2     | 24.2       | 6.2         | °C/W |
| $\psi_{JB}$                   | Junction-to-board characterization parameter | 55       | 120.9      | 9.7         | °C/W |
| $R_{\theta JC(\text{bot})}$   | Junction-to-case (bottom) thermal resistance | —        | —          | 7.7         | °C/W |

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics: UA78L02 (Legacy Chip Only)

at specified junction temperature,  $V_I = 9 \text{ V}$ ,  $C_{IN} = 0.33 \mu\text{F}$ ,  $C_{OUT} = 0.1 \mu\text{F}$  and  $I_O = 40 \text{ mA}$  (unless otherwise noted)<sup>(1)</sup>

| PARAMETER                 | TEST CONDITIONS <sup>(2)</sup>   | MIN  | TYP  | MAX | UNIT |
|---------------------------|--|--|------|-----|------|
| Output voltage            | $V_I = 4.75 \text{ V}$ to $20 \text{ V}$ , and $I_O = 1 \text{ mA}$ to $40 \text{ mA}$       | $T_J = 25^\circ\text{C}$                       | 2.5  | 2.6 | 2.7  |
|                           |  | $T_J = 0^\circ\text{C}$ to $125^\circ\text{C}$ | 2.45 |     | 2.75 |
|                           | $I_O = 1 \text{ mA}$ to $70 \text{ mA}$ , and $T_J = 0^\circ\text{C}$ to $125^\circ\text{C}$ |  | 2.45 |     | 2.75 |
| Input voltage regulation  | $V_I = 4.75 \text{ V}$ to $20 \text{ V}$ , and $T_J = 25^\circ\text{C}$                      |  | 20   | 100 | mV   |
|                           | $V_I = 5 \text{ V}$ to $20 \text{ V}$ , and $T_J = 25^\circ\text{C}$                         |  | 16   | 75  |      |
| Ripple rejection          | $V_I = 6 \text{ V}$ to $20 \text{ V}$ , $f = 120 \text{ Hz}$ , and $T_J = 25^\circ\text{C}$  |  | 43   | 51  | dB   |
| Output voltage regulation | $I_O = 1 \text{ mA}$ to $100 \text{ mA}$ , and $T_J = 25^\circ\text{C}$                      |  | 12   | 50  | mV   |
|                           | $I_O = 1 \text{ mA}$ to $40 \text{ mA}$ , and $T_J = 25^\circ\text{C}$                       |  | 6    | 25  |      |
| Output noise voltage      | $f = 10 \text{ Hz}$ to $100 \text{ kHz}$ , and $T_J = 25^\circ\text{C}$                      |  | 30   |     | µV   |
| Dropout voltage           | $T_J = 25^\circ\text{C}$   |  | 1.7  |     | V    |
| Bias current              | $T_J = 25^\circ\text{C}$   |  | 3.6  | 6   | mA   |
|                           | $T_J = 125^\circ\text{C}$  |  |      | 5.5 |      |
| Bias current change       | $V_I = 5 \text{ V}$ to $20 \text{ V}$ , and $T_J = 0^\circ\text{C}$ to $125^\circ\text{C}$   |  |      | 2.5 | mA   |
|                           | $I_O = 1 \text{ mA}$ to $40 \text{ mA}$ , and $T_J = 0^\circ\text{C}$ to $125^\circ\text{C}$ |  |      | 0.1 |      |

(1) Applies to UA78L02AC.

(2) Pulse-testing techniques maintain  $T_J$  as close to  $T_A$  as possible. Thermal effects must be taken into account separately. For legacy chip, temperature range for the UA78L02AC is  $T_J = 0^\circ\text{C}$  to  $125^\circ\text{C}$ .

## 6.6 Electrical Characteristics: UA78L033 (New Chip Only)

at specified junction temperature,  $V_I = 9 \text{ V}$ ,  $C_{IN} = 0.33 \mu\text{F}$ ,  $C_{OUT} = 0.1 \mu\text{F}$  and  $I_O = 40 \text{ mA}$  (unless otherwise noted)<sup>(1)</sup>

| PARAMETER                 | TEST CONDITIONS <sup>(2)</sup>   | MIN  | TYP  | MAX  | UNIT |
|---------------------------|--|------|------|------|------|
| Output voltage            | $V_I = 5.5 \text{ V}$ to $20 \text{ V}$ , and $I_O = 1 \text{ mA}$ to $40 \text{ mA}$ , $T_J = 25^\circ\text{C}$                         | 3.26 | 3.3  | 3.44 | V    |
|                           | $V_I = 5.5 \text{ V}$ to $20 \text{ V}$ , and $I_O = 1 \text{ mA}$ to $40 \text{ mA}$ , $T_J = -40^\circ\text{C}$ to $125^\circ\text{C}$ | 3.21 |      | 3.47 |      |
|                           | $I_O = 1 \text{ mA}$ to $70 \text{ mA}$ , $T_J = -40^\circ\text{C}$ to $125^\circ\text{C}$   | 3.23 |      | 3.45 |      |
| Input voltage regulation  | $V_I = 5.5 \text{ V}$ to $20 \text{ V}$ , and $T_J = 25^\circ\text{C}$   |      | 15   | 25   | mV   |

|                     | $T_J = -40^\circ\text{C}$ to $125^\circ\text{C}$ | $V_I = 20\text{ V}$ to $30\text{ V}$  | new chip                |     |     | 0.425 |      |
|                     |  | $I_O = 1\text{ mA}$ to $40\text{ mA}$ | UA78L15C (new chip)     |     |     | 0.01  |      |
|                     |  |                                       | UA78L15AC (new chip)    |     |     | 0.02  |      |

(1) Applies to UA78L15C and UA78L15AC.

(2) Pulse-testing techniques maintain  $T_J$  as close to  $T_A$  as possible. Thermal effects must be taken into account separately. For legacy chip, temperature range for the UA78L15C, UA78L15AC is  $T_J = 0^\circ\text{C}$  to  $125^\circ\text{C}$ . For new chip, temperature range for the UA78L15C and UA78L15AC is  $T_J = -40^\circ\text{C}$  to  $125^\circ\text{C}$ .

## 7 Detailed Description

### 7.1 Overview

The UA78L series of fixed-voltage, integrated-circuit voltage regulators is designed for a wide range of applications. The UA78L series supports a wide range of input voltages and can deliver 100 mA of load current.

This device features internal current-limiting and thermal shutdown mechanisms. To provide reliable operation across wide  $V_I$  ranges, the current-limiting mechanism modulates the load current capacity both by monitoring the  $V_O$  level and the difference between the  $V_I$  and  $V_O$  voltage levels. The operating ambient temperature range of the device is  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  for all variants of the new chip.

### 7.2 Functional Block Diagram

NOTE: Resistor values shown are nominal.

### 7.3 Feature Description

#### 7.3.1 Current Limit

The device has an internal current-limit circuit that protects the regulator during transient high-load current faults or shorting events. In a high-load current fault, the current limit scheme limits the output current to the current limit ( $I_{CL}$ ).  $I_{CL}$  is listed in the *Electrical Characteristics* table.

The output voltage is not regulated when the device is in current limit. When a current-limit event occurs, the device begins to heat up because of the increase in power dissipation. When the device is in current limit, the pass transistor dissipates power  $[(V_I - V_O) \times I_{CL}]$ . For more information on current limits, see the [Know Your Limits application note](#).

To achieve a safe operation across a wide range of Input voltage, the UA78L series also has a built-in protection mechanism with current limit. The protection mechanism decreases the current limit as input-to-output voltage increases and keeps the power transistor inside a safe operating region for all values of input-to-output voltage. This protection is designed to provide some output current at all values of input-to-output voltage limits defined in the [Recommended Operating Conditions](#) table. [图 7-1](#) shows the behavior of the current limit variation.

图 7-1. Current-Limit vs V<sub>Head-room</sub> Behavior for New Chip Only

### 7.3.2 Thermal Shutdown

The device contains a thermal shutdown protection circuit to disable the device when the junction temperature ( $T_J$ ) of the pass transistor rises to  $T_{SD(shutdown)}$  (typical). Thermal shutdown hysteresis makes sure that the device resets (turns on) when the temperature falls to  $T_{SD(reset)}$  (typical).

The thermal time-constant of the semiconductor die is fairly short, thus the device can cycle on and off when thermal shutdown is reached until power dissipation is reduced. Power dissipation during start-up can be high from large  $V_I - V_O$  voltage drops across the device or from high inrush currents charging large output capacitors. Under some conditions, the thermal shutdown protection disables the device before start-up completes.

For reliable operation, limit the junction temperature to the maximum listed in the [Recommended Operating Conditions](#) table. Operation above this maximum temperature causes the device to exceed operational specifications. Although the internal protection circuitry of the device is designed to protect against thermal overall conditions, this circuitry is not intended to replace proper heat sinking. Continuously running the device into thermal shutdown or above the maximum recommended junction temperature reduces long-term reliability.

### 7.3.3 Dropout Voltage (V<sub>DO</sub>)

Dropout voltage ( $V_{DO}$ ) is defined as the input voltage minus the output voltage ( $V_I - V_O$ ) at the rated output current ( $I_{RATED}$ ), where the pass transistor is fully on.  $I_{RATED}$  is the maximum  $I_O$  listed in the [Recommended Operating Conditions](#) table. In dropout operation, the pass transistor is in the ohmic or triode region of operation, and acts as a switch. The dropout voltage indirectly specifies a minimum input voltage greater than the nominal programmed output voltage at which the output voltage is expected to stay in regulation. If the input voltage falls to less than the value required to maintain output regulation, then the output voltage falls as well.

## 7.4 Device Functional Modes

表 7-1 provides a quick comparison between the normal and dropout modes of operation.

**表 7-1. Device Functional Mode Comparison**

| <b>OPERATING MODE</b> | <b>PARAMETER</b>              |                         |
|-----------------------|-------------------------------|-------------------------|
|                       | <b><math>V_I</math></b>       | <b><math>I_O</math></b> |
| Normal                | $V_I > V_{OUT(nom)} + V_{DO}$ | $I_O < I_{CL}$          |
| Dropout               | $V_I < V_{OUT(nom)} + V_{DO}$ | $I_O < I_{CL}$          |

### 7.4.1 Normal Operation

The device regulates to the nominal output voltage under the following conditions:

- The input voltage is greater than the nominal output voltage plus the dropout voltage ( $V_{OUT(nom)} + V_{DO}$ )
- The output current is less than the current limit ( $I_O < I_{CL}$ )
- The device junction temperature is greater than  $-40^{\circ}\text{C}$  and less than  $+125^{\circ}\text{C}$

### 7.4.2 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this mode, the output voltage tracks the input voltage. During this mode, the transient performance of the device becomes significantly degraded because the pass transistor is in the ohmic or triode region, and acts as a switch. Line or load transients in dropout can result in large output voltage deviations.

When the device is in a steady dropout state (defined as when the device is in dropout,  $V_I < V_{OUT(NOM)} + V_{DO}$ , directly after being in a normal regulation state, but *not* during start up), the pass transistor is driven into the ohmic or triode region. When the input voltage returns to a value greater than or equal to the nominal output voltage plus the dropout voltage ( $V_{OUT(NOM)} + V_{DO}$ ), the output voltage can overshoot for a short period of time while the device pulls the pass transistor back into the linear region.

## 8 Applications and Implementation

### 备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

### 8.1 Application Information

The UA78L series is designed for use as a linear regulator with only a few external components needed. The UA78L can also be used to clean power-supply noise by attenuating ripple on the input signal.

### 8.2 Typical Application

The UA78L series is typically used as a fixed-output linear regulator, sourcing current up to 100 mA into a load.

图 8-1. Fixed-Output Regulator

#### 8.2.1 Design Requirements

The COMMON pin must be tied to ground to set the OUTPUT pin to the desired fixed output voltage.

Although not required, a 0.33- $\mu$ F bypass capacitor is recommended on the input, and a 0.1- $\mu$ F bypass capacitor is recommended on the output.

#### 8.2.2 Detailed Design Procedure

##### 8.2.2.1 Input and Output Capacitor Requirements

Although both input and output capacitor are not required for stability, good analog design practice is to connect a capacitor from IN to COMMON and from OUT to COMMON. The input capacitor counteracts reactive input sources and improves transient response, input ripple, and PSRR. Use an input capacitor if the source impedance is more than 0.5  $\Omega$ . A higher value capacitor can be necessary if large, fast rise-time load or line transients are anticipated or if the device is located several inches from the input power source.

Dynamic performance of the device is improved with the use of a large output capacitor. Use an output capacitor within the range specified in the *Recommended Operating Conditions* table for stability.

##### 8.2.2.2 Power Dissipation ( $P_D$ )

Circuit reliability requires consideration of the device power dissipation, location of the circuit on the printed circuit board (PCB), and correct sizing of the thermal plane. The PCB area around the regulator must have few or no other heat-generating devices that cause added thermal stress.

To first-order approximation, power dissipation in the regulator depends on the input-to-output voltage difference and load conditions. The following equation calculates power dissipation ( $P_D$ ).

$$P_D = (V_I - V_O) \times I_O \quad (1)$$

**备注**

Power dissipation can be minimized, and therefore greater efficiency can be achieved, by correct selection of the system voltage rails. For the lowest power dissipation, use the minimum input voltage required for correct output regulation.

For devices with a thermal pad, the primary heat conduction path for the device package is through the thermal pad to the PCB. Solder the thermal pad to a copper pad area under the device. This pad area must contain an array of plated vias that conduct heat to additional copper planes for increased heat dissipation.

The maximum power dissipation determines the maximum allowable ambient temperature ( $T_A$ ) for the device. According to the following equation, power dissipation and junction temperature are most often related by the junction-to-ambient thermal resistance ( $R_{\theta JA}$ ) of the combined PCB and device package and the temperature of the ambient air ( $T_A$ ).

$$T_J = T_A + (R_{\theta JA} \times P_D) \quad (2)$$

Thermal resistance ( $R_{\theta JA}$ ) is highly dependent on the heat-spreading capability built into the particular PCB design, and therefore varies according to the total copper area, copper weight, and location of the planes. The junction-to-ambient thermal resistance listed in the *Thermal Information* table is determined by the JEDEC standard PCB and copper-spreading area, and is used as a relative measure of package thermal performance. As mentioned in the *An empirical analysis of the impact of board layout on LDO thermal performance application note*,  $R_{\theta JA}$  can be improved by 35% to 55% compared to the *Thermal Information* table value with the PCB board layout optimization.

### 8.2.2.3 Estimating Junction Temperature

The JEDEC standard now recommends the use of psi ( $\Psi$ ) thermal metrics to estimate the junction temperatures of the linear regulator when in circuit on a typical PCB board application. These metrics are not thermal resistance parameters and instead offer a practical and relative way to estimate junction temperature. These psi metrics are determined to be significantly independent of the copper area available for heat-spreading. The *Thermal Information* table lists the primary thermal metrics, which are the junction-to-top characterization parameter ( $\Psi_{JT}$ ) and junction-to-board characterization parameter ( $\Psi_{JB}$ ). These parameters provide two methods for calculating the junction temperature ( $T_J$ ), as described in the following equations. Use the junction-to-top characterization parameter ( $\Psi_{JT}$ ) with the temperature at the center-top of device package ( $T_T$ ) to calculate the junction temperature. Use the junction-to-board characterization parameter ( $\Psi_{JB}$ ) with the PCB surface temperature 1 mm from the device package ( $T_B$ ) to calculate the junction temperature.

$$T_J = T_T + \Psi_{JT} \times P_D \quad (3)$$

where:

- $P_D$  is the dissipated power
- $T_T$  is the temperature at the center-top of the device package

$$T_J = T_B + \Psi_{JB} \times P_D \quad (4)$$

where:

- $T_B$  is the PCB surface temperature measured 1 mm from the device package and centered on the package edge

For detailed information on the thermal metrics and how to use them, see the [Semiconductor and IC Package Thermal Metrics application note](#).

#### 8.2.2.4 External Capacitor Requirements

The UA78L is designed to be stable without any external component. Multilayer ceramic capacitors have become the industry standard for these types of applications and are recommended, but must be used with good judgment. Ceramic capacitors that employ X7R-, X5R-, and C0G-rated dielectric materials provide relatively good capacitive stability across temperature, whereas the use of Y5V-rated capacitors is discouraged because of large variations in capacitance.

Regardless of the ceramic capacitor type selected, the effective capacitance varies with operating voltage and temperature. Generally, expect the effective capacitance to decrease by as much as 50%. The input and output capacitors recommended in the [Recommended Operating Conditions](#) table account for an effective capacitance of approximately 50% of the nominal value.

#### 8.2.2.5 Overload Recovery

As the input voltage rises when power is first turned on, the output follows the input, allowing the regulator to start up into very heavy loads. The input-to-output voltage differential is small during start up when the input voltage is rising, allowing the regulator to supply large output currents. With a high input voltage, a problem can occur where removing an output short does not allow the output voltage to recover. Other regulators also exhibit this phenomenon, so the behavior is not unique to the UA78L.

The problem occurs with a heavy output load when the input voltage is high and the output voltage is low. Common situations occur immediately after removing a short circuit or when the shutdown pin is pulled high after the input voltage is already turned on. The load line for such a load has the possibility to intersect the output current curve at two points. If this happens, there are two stable output operating points for the regulator. With this double intersection, the input power supply can possibly need to be cycled down to zero and brought up again to make the output recover to the desired voltage operating point.

#### 8.2.2.6 Reverse Current

Excessive reverse current can damage this device. Reverse current flows through the emitter-base junction of the pass transistor instead of the normal conducting channel. At high magnitudes, this current flow degrades the long-term reliability of the device.

Conditions where reverse current can occur are outlined in this section, all of which can exceed the absolute maximum rating of  $V_O \leq V_I + 7$  V. These conditions are:

- If the device has a large  $C_{OUT}$  and the input supply collapses with little or no load current
- The output is biased when the input supply is not established
- The output is biased above the input supply

If reverse current flow is expected in the application, use external protection to protect the device. Reverse current is not limited in the device, so external limiting is required if extended reverse voltage operation is anticipated. Limit reverse current to 5% or less of the rated output current of the device in the event this current cannot be avoided.

图 8-2 shows one approach for protecting the device.

**图 8-2. Example Circuit for Reverse Current Protection Using a Schottky Diode**

#### 8.2.2.7 Polarity Reversal Protection

In many applications, a voltage regulator powers a load that is not connected to ground, but instead, is connected to a voltage source of the opposite polarity (for example, operational amplifiers, level-shifting circuits, and so on). During start-up and short-circuit events, this connection can lead to polarity reversal of the regulator output and can damage the internal components of the regulator.

To avoid polarity reversal on the regulator output, use external protection to protect the device.

图 8-3 shows one approach for protecting the device.

**图 8-3. Example Circuit for Polarity Reversal Protection Using a Schottky Diode**

## 8.3 System Examples

### 8.3.1 Positive Regulator in Negative Configuration

图 8-10 shows the UA78L as a positive regulator used in a negative configuration.

图 8-10. Positive Regulator in Negative Configuration ( $V_I$  Must Float)

### 8.3.2 Current Limiter Circuit

图 8-11 shows an example of using the UA78L as a current limiter. The output current limit is set by 方程式 5.

$$I_O = \left( \frac{V_O}{R1} \right) + I_O \text{ Bias Current} \quad (5)$$

图 8-11. Current Limiter Example

## 8.4 Power Supply Recommendations

See the [Recommended Operating Conditions](#) table for the recommended power-supply voltages for each variation of the UA78L. Each device variant can have a different recommended maximum operating voltage.

## 8.5 Layout

### 8.5.1 Layout Guidelines

Keep trace widths large enough to eliminate problematic  $I \times R$  voltage drops at the input and output pins. Place bypass capacitors as close to the UA78L as possible. Additional copper and vias connected to ground facilitate additional thermal dissipation, preventing the device from reaching thermal overload.

### 8.5.2 Layout Example

图 8-12. Example Layout for the PK Package

## 9 Device and Documentation Support

### 9.1 Device Support

#### 9.1.1 Development Support

##### 9.1.1.1 Evaluation Module

An evaluation module (EVM) is available to assist in the initial circuit performance evaluation using the UA78L. The [UA78LEVM-075](#) (and [related user guide](#)) can be requested at the Texas Instruments website through the product folders or purchased directly from the [TI eStore](#).

#### 9.1.2 Device Nomenclature

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

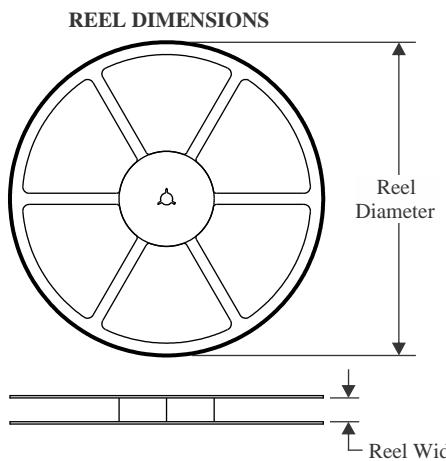

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## PK (R-PSSO-F3)

## PLASTIC SINGLE-IN-LINE PACKAGE

4040234/D 02/2006

NOTES: A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.

B. This drawing is subject to change without notice.

C. The center lead is in electrical contact with the tab.

D. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion not to exceed 0.15 per side.

$\triangle E$  Thermal pad contour optional within these dimensions.

$\triangle F$  Falls within JEDEC TO-243 variation AA, except minimum lead length, pin 2 minimum lead width, minimum tab width.

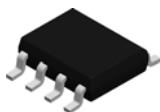

## PK (R-PDSO-G3)

Example Board Layout  
(Note C)Example Stencil Design  
(Note D)Non Solder Mask Defined Pad      Solder Mask Opening  
(Note E)

4208221/A 09/06

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525.
  - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

## SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

4214825/C 02/2019

### NOTES:

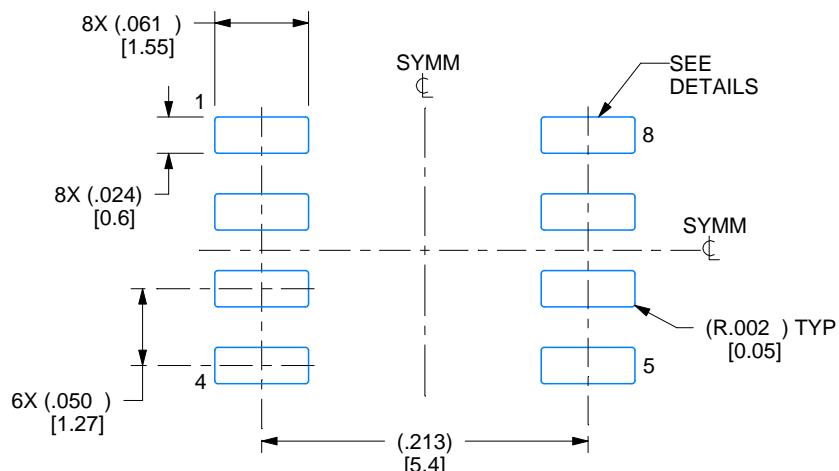

- Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
- This drawing is subject to change without notice.
- This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
- This dimension does not include interlead flash.
- Reference JEDEC registration MS-012, variation AA.

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Lead dimensions are not controlled within this area.
4. Reference JEDEC TO-226, variation AA.
5. Shipping method:
  - a. Straight lead option available in bulk pack only.
  - b. Formed lead option available in tape and reel or ammo pack.
  - c. Specific products can be offered in limited combinations of shipping medium and lead options.
  - d. Consult product folder for more information on available options.
